

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

#### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

#### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

#### ADVERTISEMENT.

The scientific publications of the National Museum consist of two series—the Bulletin and the Proceedings.

The Bulletin, publication of which was begun in 1875, is a series of more or less extensive works intended to illustrate the collections of the U. S. National Museum and, with the exception noted below, is issued separately. These bulletins are monographic in scope and are devoted principally to the discussion of large zoological and botanical groups, faunas and floras, bibliographies of eminent naturalists, reports of expeditions, etc. They are usually of octavo size, although a quarto form, known as the Special Bulletin, has been adopted in a few instances in which a larger page was deemed indispensable.

This work forms No. 69 of the Bulletin series.

Since 1902 the volumes of the series known as "Contributions from the National Herbarium," and containing papers relating to the botanical collections of the Museum, have been published as bulletins.

The *Proceedings*, the first volume of which was issued in 1878, are intended as a medium of publication of brief original papers based on the collections of the National Museum, and setting forth newly-acquired facts in biology, anthropology, and geology derived therefrom, or containing descriptions of new forms and revisions of limited groups. A volume is issued annually, or oftener, for distribution to libraries and scientific establishments, and in view of the importance of the more prompt dissemination of new facts a limited edition of each paper is printed in pamphlet form in advance.

RICHARD RATHBUN.

Assistant Secretary, Smithsonian Institution, In Charge of the United States National Museum.

## PREFACE.

In 1900, while a graduate student at the University of Nebraska, I undertook, upon the suggestion of Prof. Henry B. Ward, of the department of zoology, an investigation relative to the cestodes of birds. So far as the North American fauna was concerned, this topic represented a field which had scarcely been touched. Although a considerable number of species had been reported from birds occurring in North America, the descriptions of most of these forms were based upon specimens collected in other parts of the world from birds belonging to species whose range included this continent, or which had been introduced here either wild or in a state of domestication.

Owing to interruptions this investigation has never been carried out to the extent originally planned. However, a number of hitherto unknown species, and some already named but imperfectly known species, have been studied and described, and a synopsis prepared of the superfamily Tænioidea to which they belong, together with a list of all the species which have been reported as parasites of birds occurring in North America. This material was presented to the graduate faculty of the University of Nebraska as a thesis for the degree of doctor of philosophy and accepted January 4, 1908. Delay in its final preparation for publication has enabled me to take into consideration a number of recent papers, the most important of which are those of Dr. O. Fuhrmann, the well-known authority on avian cestodes. It has thus been possible to incorporate some valuable data that would otherwise have been omitted.

To Prof. H. B. Ward, of the University of Nebraska, I am indebted for much helpful advice during the progress of my investigations, and to Mr. H. C. Oberholser, of the Biological Survey, U. S. Department of Agriculture, for his kindly assistance in selecting for me the names of hosts as recognized by ornithologists at the present time.

B. H. RANSOM.

## THE TÆNIOID CESTODES OF NORTH AMERICAN RIRDS

By Brayton Howard Ransom,
Assistant Custodian. Helminthological Collections. U. S. National Museum.

#### INTRODUCTORY REMARKS.

The tænioid cestodes are tapeworms characterized primarily by the presence of four cup-shaped suckers upon the head. They form a natural group, classed by some authorities as a superfamily Tænioidea, by others as an order Cyclophyllidea. At least 8 families may be recognized, and nearly 70 genera. Over 50 of these genera are represented among the species, about 500 in number, parasitic in birds. About 140 species have been reported from North American birds, and these represent nearly 40 genera. It is with these forms that the present paper is concerned. In order to render clear their relationships, it has been considered desirable to include a synopsis of the entire superfamily to which they belong, giving a diagnosis of every known genus in the group and a key to genera. By means of this key a given specimen may readily be placed in its proper genus. Under each genus is given a list of all species known to occur in North American birds, with references to the more important published descriptions which will be of material assistance in arriving at specific determinations, and in this connection the compendium of parasites arranged according to hosts will also be useful.

Preceding the synopsis are given a few notes on the collection and preservation of specimens, and descriptions of a number of species which have been specially studied.

#### NOTES ON COLLECTION AND PRESERVATION OF SPECIMENS.

The tapeworms of birds are found usually in the small intestine. The collection of specimens is not particularly difficult. The small intestine is slit from end to end with a pair of scissors of suitable size, and by stripping the slit intestine between the thumb and finger or by scraping the inner surface with the back of a scalpel blade the contents are removed into a tall vessel (beaker or glass cylinder) of physiological salt solution. In some cases special care is required if the heads of the worms are to be obtained, and it may be necessary to cut

off and place in a shallow dish of salt solution portions of the intestine to which the worms are attached, and by careful manipulation with the back of a scalpel blade cause them to release their hold. In the tall vessel of salt solution the taneworms and more or less ingesta will sink to the bottom within a few minutes. It is well to break up the masses or clumps of material which sometimes float on the surface of the salt solution in order to dislodge any worms which may be entangled there and thus give them opportunity to sink. ficiently settled, the top of the liquid should be poured off until the layer at the bottom containing the tapeworms is reached. The vessel is then filled up again and the liquid stirred a little and allowed to settle as before. This operation is repeated until the fluid is no longer cloudy when agitated. The tapeworms and such ingesta as may be remaining at the bottom are poured out with a sufficient amount of liquid into a shallow flat-bottomed glass dish, for example, a petri dish of suitable size. The worms may now be readily seen by placing the dish over a dark background, and may be picked out by means of a dissecting needle, splinter of wood, etc., or, if very small, by the use of a pipette. It is advisable, in order that very small forms may not be overlooked, that the contents of the dish be carefully examined with a lens. If the worms are small and very numerous, they may be poured with the ingesta and the supernatant liquid into a beaker, as much of the salt solution as possible removed by pouring or by drawing off with a pipette, and the killing solution then added. Otherwise it is better to pick out the worms from the ingesta and put them into a dish of clean salt solution, which may be drawn off and replaced several times in order to free the worms from mucus and adherent foreign particles.

A very satisfactory killing solution is a mixture of equal parts of 70 per cent alcohol and saturated aqueous solution of corrosive sublimate, to which, after mixing, about 1 per cent of glacial acetic acid is This mixture may be employed cold, but acts better when heated to about 70° or 80° C. A liberal quantity should be used. The worms may be lifted into the killing solution one by one on a wooden splinter (metal should not be used on account of the action of the corrosive sublimate, which will cause the worms to blacken where touched by the metal), or they may be dumped into the killing reagent together with the least possible quantity of salt solution, or the process may be reversed and the killing reagent poured on the worms after as much of the salt solution as possible is drawn off. When the worms are long and liable to tangle and twist into knots, the first method is preferable. Occasionally the worms, if very active, get into this condition in the salt solution, and require to be disentangled before fixation. This may generally be accomplished with the aid of a couple of dissecting needles.

According to the size of the worms, the killing solution is allowed to act from ten to twenty minutes, rarely longer. It is then poured off or removed with a pipette and replaced with 70 per cent alcohol, to which enough of a solution of iodine in alcohol is added to give it a sherry-wine tint. If after a day or two all the color has disappeared from the alcohol, more iodine solution is added, and this is repeated if necessary. When no further extraction of color is apparent, the alcohol is poured off and fresh 70 per cent alcohol added, in which the specimens may remain until required for study.

When conveniences required in the technic described above are lacking, tapeworms may be preserved by simply opening the intestine of the bird, spreading it out on a piece of board or paper, scraping off the parasites with a knife and putting them directly into 70 per cent alcohol or 5 to 10 per cent solution of formalin. Less favorable specimens are, of course, to be expected from this method than from the other

The label should show the name of the host (it is important that the species of the bird should be accurately determined, and it is advisable to give the common name as well as the scientific name), the locality, the date, and the collector's name.

Some specimens afford toto mounts favorable for study; in others, on account of the thickness or the contracted condition of the worm, practically nothing can be made out from toto mounts concerning the internal structure, but by pressing a specimen between two glass slides after it has been softened for twelve to twenty-four hours in water and bringing it into strong alcohol again before the pressure is removed, it can generally be sufficiently flattened so that the internal structure becomes more apparent. Before this flattening is done, however, the specimens should be stained, the most generally useful stain being alcoholic acid carmine. The specimens may be stained overnight in dilute stain and then decolorized by soaking in 70 per cent alcohol, to which two or three drops of hydrochloric acid to the 100 c. c. have been added. The stage at which to stop decolorization can only be determined by experience. After staining and flattening, the specimens are dehydrated, cleared in xylene or cedar oil, and mounted in balsam. Small worms may be mounted entire. larger ones in pieces. If the head is armed with hooks and their shape and size can not be accurately determined in a toto mount, and if a sufficient number of specimens are available, preparations to show these structures may be made by tearing the heads into small pieces with fine pointed needles and mounting in glycerin, glycerin ielly, or balsam.

In addition to toto mounts serial sections are indispensable in working out the details of internal structure. These should be made

with portions from various regions of the strobila chosen to show the male and female organs in different stages of development. Transverse and frontal sections are the most useful; occasionally sagittal sections are valuable. Except for fine histological details, thick sections are more satisfactory than thin ones.

#### DESCRIPTION OF SPECIES.

Genus DAVAINEA Blanchard and Railliet, 1891.

(For generic diagnosis see p. 67.)

#### DAVAINEA RHYNCHOTA, new species.

#### Figs. 1-4.

This species is represented by specimens in the collection of the U. S. National Museum, and of H. B. Ward, collected in Nebraska, Iowa, and Maryland, from *Colaptes auratus* and *Melanerpes erythrocephalus*.

The type-specimens (from the collection of H. B. Ward, deposited in the U. S. National Museum Helminthological Collection, No. 7235) were collected in Iowa from *Colaptes auratus*.

#### External anatomy.

The length of this form is 50 to 60 mm., the maximum width about 1 mm.

The head (fig. 1) measures 360 to  $380\mu$  long and 320 to  $380\mu$  broad. Its anterior portion forms a large protuberance, cylindrical or truncate conical in shape, measuring  $160\mu$  in length by 150 to  $250\mu$  in breadth. The surface of this protuberance, as in *Davainea frontina* (Dujardin), is thickly covered with minute spines arranged in diagonal rows. The rostellum proper is a muscular bulb, broad (120 to  $160\mu$ ) and flat, embedded in the anterior end of the spine-covered protuberance. It is armed with a crown of alternating longer and shorter hooks (figs. 2a and b), 18 and  $14\mu$  in length, respectively, and about 400 in number. Instead of being circular the crown of hooks forms a rosette with 8 limbs.

The suckers are round, 150 to  $160\mu$  in diameter, with their borders armed with numerous hooklets (fig. 2c) of varying size up to  $10\mu$ , arranged in diagonal rows, 16 to 18 hooklets in each row.

The neck is somewhat narrower than the head, measuring 160 to  $250\mu$  in breadth, and varying in length according to the state of contraction (observed maximum  $400\mu$ ). The first segments are equal in width to the neck and are very short, gradually increasing in both dimensions toward the posterior end of the strobila, where they measure 0.5 mm. in length and 1 mm. in width. The number of segments

in a strobila 50 mm. long was about 175. The posterior 8 or 10 segments in this strobila contained fully formed eggs. In shape the segments are trapezoidal, broader than long, and the posterior border of

each segment overlaps more or less the anterior portion of the next following segment.

The genital pores are unilateral on the left-hand margin of the strobila, located slightly in front of the middle of each segment.

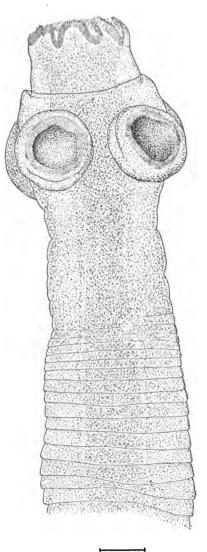

#### Internal anatomy.

Nervous system.—The lateral longitudinal nerves are well developed, situated toward the lateral borders of the segment just within the inner layer of longitudinal muscles.

Muscle system.—The longitudinal muscles are arranged in two layers; a thicker outer layer of several irregular rows of very numerous small bundles and a thinner inner layer of larger bundles in a single row, about 40 in number, 20 in the dorsal and 20 in the ventral half of the segment. The dorso-ventral and transverse muscle systems are very weakly developed.

Excretory system.—The dorsal (fig. 3, d. ex.) and the ventral excretory canal are situated in about the same vertical longitudinal plane a short distance from the lateral nerve on its inner side. The dorsal canal is, as usual, the smaller and its course more wavy.

In a segment in which the ventral canals measured  $60\mu$  in diameter the dorsal canals measured  $15\mu$ 

100д.

FIG. 1.—DAVAINEA RHYNCHOTA: HEAD AND ANTERIOR PORTION OF STROBILA.

The ventral canals are connected by a transverse canal in the posterior portion of each segment; the dorsal canals (fig. 3) are also connected in the same region in most of the segments by a slender transverse canal.

With the exception of the cirrus pouch and the distal portion of the vagina, the reproductive organs are all contained in the medullary portion of the segment, as the portion within the inner longitudinal muscle layer may be termed. The vas deferens and vagina pass

(a) (b) (b)

Fig. 2.—DAVAINEA BHYNCHOTA: HOOKS. (a) LARGE HOOK FROM ROSTELLUM. (b) SMALL HOOK FROM ROSTELLUM. (c) HOOK FROM SUCKER.

The vas deferens and vagina pass between the dorsal and ventral excretory canals and dorsal of the lateral longitudinal nerve.

Male reproductive organs.—The testicles (fig. 3, t.) are of the usual oval shape, elongated dorso-ventrally, measuring 60 to  $120\mu$  in diameter, in number about 24. They are located in the lateral and posterior portions of the segment, inside of the inner layer of longitudinal muscles, extending forward to the anterior border of the segment on the dextral side. On the sinistral side of the segment the testicles do not extend so far forward, the an-

terior third of the segment on this side being occupied by the vas deferens and seminal receptacle.

In segments in which the female glands are at the height of their development the testicles in the middle third of the segment are

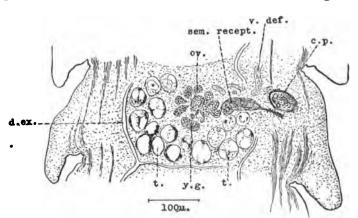

FIG. 3.—DAVAINEA RHYNCHOTA: SEXUALLY MATURE SEGMENT, HOBIZONTAL SECTION. c. p., CIRRUS POUCH. d. ex., Dorsal excretory vessel. ov., Ovary. sem. recept., Seminal receptacle. t., Testicles. v. def., Vas deferens. y. g., Yolk gland.

crowded toward the sides and are then disposed in two groups, one in each lateral third of the medullary portion of the segment. In a segment containing 22 testicles, 9 were located on the left-hand (pore) side of the segment and 13 on the right-hand side. The vasa efferentia unite near the middle of the segment, toward the dorsal

side of the medullary portion, to form the vas deferens, which extends forward nearly to the anterior border of the segment, and then laterally in a very tortuous course toward the genital pore. The mass of coils formed by the vas deferens occupies most of the anterior third of the medullary portion of the segment on the left-hand side of the median line. The middle portion of the vas deferens is commonly dilated in older segments, forming a capacious seminal reservoir measuring 40 to  $60\mu$  in diameter; the remainder of the vas deferens measures about  $10\mu$  in diameter.

The cirrus pouch (figs. 3, 4, c. p.) measures 115 to  $135\mu$  in length and has the pyriform shape common in the genus *Davainea*. The outer muscular layer is very thin, 2 to  $3\mu$ , the fibers running mostly lengthwise in the basal portion and transversely in the distal portion of the pouch. The vas deferens after entering the cirrus pouch is

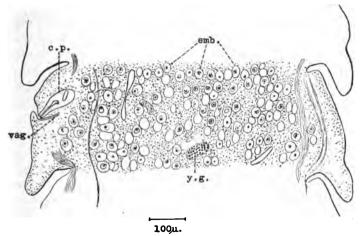

FIG. 4.—DAVAINEA RHYNCHOTA: GRAVID SEGMENT, HORIZONTAL SECTION. c. p., CIRRUS POUCH. emb., Eggs. rag., Vagina. y. g., Yolk gland.

supplied with a muscular wall, and its terminal portion is modified to form the cirrus, which in the retracted condition measures 50 to  $60\mu$  in length and 2 to  $4\mu$  in diameter, without apparent spines.

Female reproductive organs.—The vagina (fig. 4, vag.) opens into the genital sinus immediately behind the male opening, and extends inwards along the posterior side of the cirrus pouch. The distal portion of the vagina has a thick muscular wall and measures from 200 to  $235\mu$  in length. Before crossing the excretory canals the vagina becomes very thin-walled, and in older segments the thin-walled portion is dilated to form an elongated seminal receptacle (fig. 3, sem. recept.). Near the center of the segment the vagina joins the oviduct.

The ovary (fig. 3, ov.) is situated in the middle of the segment, and measures about 250 to  $320\mu$  in width when fully developed. It is a compact lobulated organ deeply hollowed out behind. In this space

is situated the yolk gland (fig. 3, y. g.) ventrally, and the shell gland dorsally. The yolk gland measures from 75 to  $100\mu$  in diameter and the shell gland from 30 to  $50\mu$ .

As in other members of the genus Davainea, a definite functional uterus is not developed. The eggs (fig. 4, emb.) in gravid segments are scattered throughout the medullary portion, isolated in the parenchyma and not grouped together in capsules. They are surrounded by three membranes, a thin inner one close to the oncosphere, which measures 20 to  $25\mu$  in diameter, a thicker middle one 27 to  $33\mu$  in diameter, and a thin outer membrane 35 to  $50\mu$  in diameter. The last is apparently deposited by small cells 4 to  $6\mu$  in diameter, with deep staining nuclei about  $2\mu$  in diameter, which largely fill up the spaces between the eggs.

#### Remarks.

Davainea compacta Clerc (1906, p. 725, fig. 22) from Oriolus galbula is very similar to D. rhynchota. As described by Clerc it is 150 mm. in length by 1.3 mm. in breadth. The scolex is  $330\mu$  in diameter. The rostellum is armed with about 400 hooks arranged in two rows. The larger hooks measure  $15\mu$  in length. The hooks on the suckers measure  $10\mu$  in length. The segments are always broader than long. The genital pores are unilateral and the genital canals pass between the excretory vessels. The testicles are about 25 in number and the cirrus pouch measures  $150\mu$  in length. The ovary occupies about one-third the width of the segment. The eggs are very small, the embryo measuring but  $14\mu$  in diameter, and they are contained singly in egg capsules.

Davainea compacta and D. rhynchota correspond very well in the size of the head, number, and size of hooks on the rostellum, their arrangement in a double crown, size of the hooks on the suckers, unilaterality of the genital pores, shape of the segments, number of testicles, size of the ovary, and the arrangement of the eggs singly in egg capsules. Davainea compacta, however, is a much longer species than D. rhynchota (not an important difference), the cirrus pouch is somewhat larger, and the eggs are much smaller, the embryo of the former being but  $14\mu$  in diameter, of the latter about  $25\mu$ . The two apparently differ in regard to the rostellum. The presence of spines over the surface of the very prominent rostellum, and the rosette arrangement of the hooks are marked features of Davainea rhynchota, which would hardly have been overlooked by Clerc if they were present in Davainea compacta. The differences between the two forms seem fully sufficient to justify the recognition of the two species.

Of the tapeworms which have been reported from woodpeckers, Davainea cruciata (Rudolphi) and D. longispina Fuhrmann, 1908,

are the only other species of this genus besides Davainea rhynchota, in which the eggs are not grouped in egg capsules. Davainea cruciata, as described by Fuhrmann (1909, p. 111) from the type-speci-

mens, possesses only about 200 hooks on the rostellum, and the cirrus pouch measures only about  $70\mu$  in length. This species is therefore clearly different from D. rhynchota. That D. longispina as described by Fuhrmann (1909, p. 112) is a different species from D. rhynchota is evident from the facts that the rostellum measures but  $64\mu$  in diameter and that the genital pore is located in the posterior half of the segment.

#### DAVAINEA COMITATA, new species.

#### Figures 5-8.

This form occurs in Colaptes auratus and Melanerpes erythrocephalus, commonly in company with the preceding species. It has been collected in Iowa, Nebraska, and Maryland. The typespecimen (from the collection of H. B. Ward, deposited in the U. S. National Museum Helminthological Collection, No. 7234) was collected in Iowa from Colaptes auratus.

External anatomy.

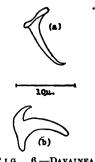

FIG. 6.—DAVAINEA
COMITATA: HOOKS.
(a) FROM SUCKER.
(b) FROM BOSTELLUM.

Davainea comitata measures 45 to 55 mm. in length, with a maximum breadth of 1.16 mm.

The head (fig. 5) is 250 to 320 $\mu$  long and 250 to 290 $\mu$  broad, covered thickly with

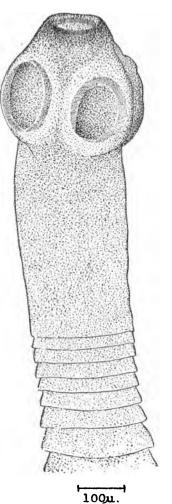

FIG. 5.—DAVAINEA COMITATA:
HEAD AND ANTERIOR PORTION OF
STROBILA.

minute spines in its anterior portion over a zone about  $75\mu$  in width bordering the rostellum. This spine-covered zone corresponds to the prominent protuberance of the head in *Davainea rhynchota*.

The rostellum is about  $90\mu$  in diameter, armed with a crown of about 80 hooks (fig. 6b) 11 to  $13\mu$  long arranged in a single row.

The suckers are oval, 115 to  $135\mu$  wide by  $160\mu$  long, armed with numerous hooklets (fig. 6a)  $10\mu$  and less in length, arranged in diagonal rows on the border of the suckers, 16 to 18 in each row.

The neck is of variable length up to  $400\mu$ , and measures in width from 200 to  $300\mu$ .

The segments are similar in shape to those of Davainea rhynchota and increase gradually in size toward the posterior end of the strobila. In a strobila 45 mm. long the number of segments was approximately 175, of which the last 17 contained egg capsules. A segment (No. 130) in the middle of the strobila measured  $320\mu$  in length by  $880\mu$  in width, and a segment at the end of the strobila measured  $650\mu$  in length by 1.6 mm. in breadth. In some cases the gravid segments are equal in length and breadth.

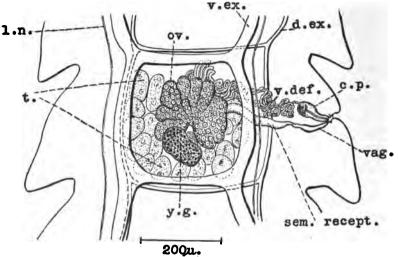

FIG. 7.—DAVAINEA COMITATA: SEXUALLY MATURE SEGMENT, RECONSTRUCTION FROM SECTIONS, VENTRAL VIEW. c. p., CIRRUS POUCH. d. ex., DORSAL EXCRETORY VESSEL. l. n., NERVE CORD. ov., OVARY. sem. recept., SEMINAL RECEPTACLE. t., TESTICLES. vag., VAGINA. v. def., VAS DEFERENS. v. ex., VENTRAL EXCRETORY VESSEL. y. g., YOLK GLAND.

The genital pores are unilateral on the left-hand margin of the strobila, situated in about the middle of each segment.

#### Internal anatomy.

The nervous system, musculature, and excretory canals are arranged as in *Davainea rhynchota*, and the relative location of the reproductive organs is the same.

The vas deferens and vagina pass between the excretory canals and dorsal of the nerve cord, as in the other species.

Male reproductive organs.—The testicles (fig. 7, t.) number from 30 to 35, arranged in a mass occupying the lateral and posterior por-

tions of the segment within the inner field. As in Davainea rhynchota, on the right-hand side this mass extends nearly to the anterior border of the segment; on the left-hand (pore) side it is limited to the posterior two-thirds. The vas deferens (fig. 7, v. def.) forms a mass of coils in the anterior third of the segment extending from the median line to the base of the cirrus pouch. The cirrus pouch (figs. 7, 8, c. p.) is pyriform in shape, with thin outer muscular wall, as in Davainea rhynchota. It is, however, somewhat smaller in the present species, measuring 90 to  $100\mu$  in length by 45 to  $50\mu$  in diameter in its widest portion. The arrangement in the pouch of the vas deferens and cirrus is similar to that in the other species. The cirrus is without apparent spines, and measures in the retracted condition about  $50\mu$  in length by 2 to  $4\mu$  in diameter.

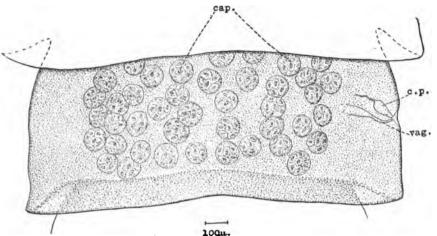

FIG. 8.—DAVAINEA COMITATA: GRAVID SEGMENT, VENTBAL VIEW. cap., Egg CAPSULES.
c. p., CIRRUS POUCH. vag., VAGINA.

Female organs.—The vaginal opening is immediately posterior of the male opening. The vagina and seminal receptacle are in this form similar to those of Davainea rhynchota, with the exception that the vagina for a distance of  $25\mu$  from the genital pore is constricted, and this constricted portion is surrounded by a bulbous sphincter.

The ovary (fig. 7, ov.), located as in Davainea rhynchota, is similar in shape, lobulation, etc., and measures about  $200\mu$  in width at its maximum of development.

Posterior and ventral of the ovary is the yolk gland (fig. 7, y. g.) 100 to  $130\mu$  in diameter, and dorsal and anterior of the latter is the small shell gland,  $50\mu$  in diameter.

In the gravid segment the eggs are grouped 6 to 12 together in egg capsules (fig. 8, cap.), measuring 80 to  $90\mu$  in diameter. From 40 to 50 capsules are visible from a surface view of the segment. They are confined to the medullary portion of the segment inside the inner

3264—Bull, 69—09——2

layer of longitudinal muscles. The eggs are supplied with two thin membranes, an inner one close to the oncosphere, which measures 18 to  $20\mu$  in diameter, and an outer one 30 to  $35\mu$  in diameter.

#### Remarks.

In addition to D. comitata, two species of Davainea, in which the eggs are grouped in egg capsules, have been reported from woodpeckers—namely Davainea frontina (Dujardin) and D. lutzi Parona. It is possible that in D. cruciata (Rudolphi) also there is a grouping of the eggs in egg capsules, but Fuhrmann (1909, p. 111) says that the eggs, probably, are isolated in the parenchyma, as in D. longispina Fuhrmann. D. comitata is certainly, however, specifically different from D. cruciata, since it possesses only about 80 hooks on the rostellum, whereas the latter has about 200. Davainea frontina has about 280 hooks and is thus distinct from D. comitata. The size of the hooks in D. lutzi—namely, 18 to  $19\mu$  in length—distinguishes this species from D. comitata, whose hooks are only 11 to  $13\mu$  in length. The two species are also different, in that D. lutzi has but 12 to 16 egg capsules in each segment (Fuhrmann, 1909, p. 112), while D. comitata has 40 to 50.

#### Genus LIGA Weinland, 1887.

For generic diagnosis see p. 80.)

The genus Liga, proposed by Weinland (1857b, p. 62), has up to the present time received practically no recognition by other authors, and in few instances has it even been mentioned. Stiles (1906a, p. 62) lists Liga as a possible synonym of Davainea and also refers to it in an earlier paper (1903hh); it has also been noted by Fuhrmann (1907a, p. 292; 1908a, p. 60), but other writers have passed it by without comment.

Weinland's original description of Liga and its type species Liga punctata is as follows:

#### OBSERVATIONS ON A NEW GENUS OF TÆNIOIDS.

In the middle of April, 1856, I found a single living specimen of a new kind of tapeworm in the small intestine of our gold-winged woodpecker (*Picus auratus*). This *Tænia* is remarkable for the structure of its organs of reproduction.

As in the human tapeworm (*Tænia solium*), so also in this, the genital openings alternate from one articulation to the next; but in the former, and as seems generally to be the case in Tænioids, the testicles lie in the middle of each articulation. (See von Siebold, Vergleichende Anatomie der wirbellosen Thiere, p. 147; and the figure in Blanchard, Recherches sur l'organization des Vers, pl. 15, figs. 4, 7.) They were placed, on the contrary, in the tapeworm of the woodpecker, in the anterior part of the articulation, just in front of the

genital opening, filling up by a large mass of convolute spermatic canals all that part of the articulation, and thus excluding from it the uterus. Furthermore, the uterus did not consist of branched, tree-like canals (see Blanchard, l. c.), but, on the contrary, of a large number of balls, perhaps connected with each other by slender ducts. Von Siebold (l. c., p. 146, and note 23) seems to speak of a similar structure observed by him or Della Chiaje in *Tænia ocellata*, and Dujardin (Histoire naturelle des helminthes, Paris, 1845) has observed exactly the same structure of the uterus in a tapeworm of the European *Picus major*.

As in other tapeworms, the spermatozoa were very fine, filiform, of one diameter throughout, without the so-called head or body of other spermatozoa. But what was very strange, these spermatozoa were of very different lengths; some twisted, thrice or even four times as long as others. Moreover, they would readily break into pieces and were not so soft and pliable as they generally are. I saw several break into two pieces (particularly when coming out from the cirrus bag) and both pieces moved on. Whether this phenomenon occurred accidentally or whether it was a natural characteristic of these spermatozoa I am at a loss to say. No water was used in the examination, of the bad effects of which upon spermatozoa I am fully aware. In either case this is a subject worthy the investigation of physiologists, for such a power of division would imply a nature in these spermatozoa entirely different from what we have hitherto observed. Other spermatozoa present individual elements: on the contrary, those of this tapeworm would be really dividual, at least virtually, as they have the faculty of dividing and thus multiplying themselves. Not the slightest difference could be observed in activity, movement, or form between the divided portions and the whole animals, so that we may suppose that each of the divided pieces had the fructifying power as well as the others. Furthermore, the motion of these spermatozoa was extraordinary. Whilst others move in a peculiar, quick, vibratory manner, these progress much more slowly in a succession of long curves, reminding one of the motion of an eel at the bottom

This same tapeworm is also remarkable for the strange shape of its eggs, While the eggs of tapeworms generally are globular or oval, the shape of these was that of a large ball running out on both sides into tubes which terminated in balls of about half the diameter of the central one. I found these eggs in all stages of development, some containing nothing but a clear yolk, while others presented embryos with six little spines. The yolk as well as the embryo was found only in the central ball, and there also the yolk membrane terminated. Thus the lateral tubes of the egg, as well as the balls in which they terminated, are to be considered merely as excrescences and appendages of the outer (the third) coating of the egg. Similar appendages to the eggs of tapeworms have been met with previously by other observers, namely, threads running out on two sides in Tania infundibuliformis and planiceps, by von Siebold (l. c., p. 148), and Tania cyathiformis, by Dujardin (l. c., p. 568, and figured pl. 9, fig. R., 2), while von Siebold (l. c.) describes the eggs of the same worm as provided at the pointed ends of their outer pear-shaped coatings with two bladder-like appendages, which remind one more of the new form just described. Two delicate tufts, one on each side, have been observed by Meissner in Mermis nigrescens (Beitræge zur Anatomie und Physiologie der Gordiaceen, in von Siebold and Kölliker's Zeitschrift f. Wissensch. Zool., vol. 7, pl. 2, fig. 2), and by Siebold (l. c.) in Tania variabilis. All these appendages belong to the third coating of the egg, adjoining the so-called chorion. Analogous appendages are found in the eggs of sharks and skates. Some of the embryos were hatched under my eyes, and in spite of the greatly different organization of the adult worms, their organization was seen to be throughout identical with that of the embryos of the genuine Twnias (those of man, dog, cat, etc.), namely, a roundish disk, containing smaller and larger granules, and provided with six little spines, disposed in three pairs, two lateral and one in front. \* \*

The new genus, which we found upon the structural peculiarities mentioned above, we will call Liga, and the species, from its many yellowish-brown dots, punctata.

A full description of both genus and species, with drawings, will be given on some future occasion.

In 1858 (1858c, pp. 14, 16, 52) Weinland refers a number of times to the tapeworm from the golden-winged woodpecker, and although he does not use the name Liga punctata there can be no doubt that he has in mind the species which he described in 1857. Weinland (1858c, p. 52) classes the "Tænioid from the golden-winged woodpecker" in the subgenus Dilepis, genus Hymenolepis, from which fact inferences may be drawn with regard to certain characters of Liga punctata which were not clearly defined in the earlier paper.

The following characters are given by Weinland for the genus Hymenolepis: "The outer shell of the egg membranaceous; one, rarely two, rows of small hooklets on the proboscis. The hooklets much less developed than in the Sclerolepidota. Uterus consisting of ball-like blind sacs." In the subgenus Dilepis "the egg has two shells only; the outer shell is membranaceous, and often bears strange appendages."

By combining these data with the description given in the earlier paper we find the essential characters of *Liga punctata* to be as follows:

Head armed with one or two rows of small hooklets. Strobila with many yellowish-brown punctations. Genital pores alternate at or in front of the middle of the segment. Vas deferens a forming a mass of coils in the anterior portion of the segment in front of the genital pore. Uterus consisting of a large number of blind sacs, perhaps connected with one another. Eggs with two shells; outer shell membranaceous, with a tubular process at each pole terminating in a globular expansion.

Although from the more modern standpoint, Weinland's account of Liga punctata is rather meager, the characters given would seem sufficient to enable the species to be recognized in case it should again be met with, and I believe that there can be no reasonable doubt that certain tapeworms which I have found in the goldenwinged woodpecker (Colaptes auratus) belong to the identical

<sup>&</sup>lt;sup>a</sup>The large mass of convolute spermatic canals in the anterior part of the segment, which Weinland (1857b) mentions, evidently represents the vas deferens, and not, as misinterpreted by Weinland, testicles.

species described by Weinland. Furthermore, it appears upon comparing these specimens with Fuhrmann's (1907b, p. 521) description and figure of *Fuhrmannia brasiliensis* from *Picus*, species, Brazil, incompletely described by Parona in 1901, that the latter is of the same species.

In accordance with the International Code of Zoological Nomenclature the name Liga punctata is invalid, since prior to the publication of this name the species to which it belongs was referred to under the name of Tania punctata, which is a homonym of Tania punctata Rudolphi, 1802. This reference (Weinland, 1856a, p. 25) is as follows:

In another and new species of tapeworm, the *Tænia punctata* Weinl., found in the golden-winged woodpecker, he had observed the embryo just hatching. The shell of the egg of the worm has two processes, each terminating in a large ball; the embryo is provided with six spines.

Tania punctata Weinland, 1856, being a homonym, and Liga punctata accordingly invalid, the species takes the next available name, which is Liga brasiliensis (Parona, 1901).

LIGA BRASILIENSIS (Parona, 1901) Ransom, 1909.

#### Figs. 9-14.

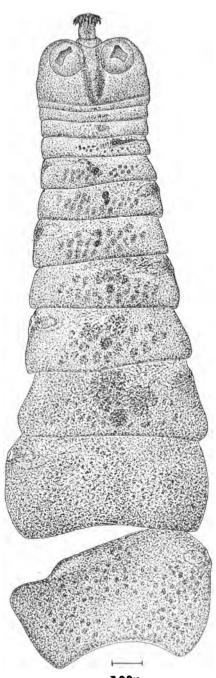

Tania punctata Weinland, 1856a, p. 25 (not T. punctata Rudolphi, 1802).— Braun, 1894a, p. 1143; 1900a, p. 1670.

Liga punctata Weinland, 1857b, p. 62.—Stiles, 1903hh, pp. 19, 20; 1906a, p. 62.—Fuhrmann, 1907a, p. 292; 1908a, pp. 60, 61, 169.

Fuhrmannia brasiliensis Parona, 1901b, pp. 10-11; 1901a, pp. 8-9.—Fuhrmann, 1907b, p. 521, fig. 12; 1907a, p. 292; 1908a, pp. 28, 60, 61.

Fuhrmann describes Fuhrmannia brasiliensis as a very small cestode, consisting when mature of only about 16 proglottids; its length scarcely 3 mm., its greatest breadth 0.5 mm. The scolex has a diameter of 0.39 mm., suckers 0.15 mm. The rostellum is armed with a double crown of hooks, which are almost exactly similar in shape. Each crown consists of 10 hooks, the larger of which measure 0.043 mm., the smaller 0.039 mm. in length. Genital pores regularly alternate. Testicles 12 to 14 at posterior border of segment. Cirrus pouch small, pyriform. Cirrus surrounded at its base by a crown of long fine spines, forming in the genital cloaca a small dark staining cone. The last segment is entirely filled with the sac-like uterus and measures 0.7 mm. in length and 0.5 mm. in breadth. Oncosphere 0.027–0.03 mm., outer membrane, 0.043 mm. in diameter. The outermost shell appears to have not yet developed.

The specimens upon which the following description is based were collected from the small intestine of a golden-winged woodpecker (*Colaptes auratus*) killed near Bowie, Maryland. They are preserved in the Helminthological Collection of the Bureau of Animal Industry, No. 4577.

1001.
Fig. 9.—Liga brasiliensis: Entire worm.

The worms (fig. 9) possess from 12 to 15 segments, a number slightly less than that given by Fuhrmann, who writes that there are about 16 segments. A specimen with 12 segments measured 3 mm. in length by 0.7 mm. in width.

The head (fig. 9) is 200µ long by 400µ wide, with well-developed rostellum (fig. 10) armed with 20 hooks (fig. 11), arranged in a double crown of alternating longer and shorter hooks. longer hooks measure 45 to 50 u in length which is practically the same size as that given by Fuhr-The hooks of the two mann. rows are similar in shape and possess a long dorsal root and a short ventral root, the dorsal root and blade of the hook being about equal in length. Suckers 135µ (150µ Fuhrmann) in diam-Segmentation begins immediately behind the head. The length of the segments gradually increases, and beginning with about the fifth segment an increase in width also takes place, the twelfth segment measuring  $360\mu$  long by  $700\mu$  wide. In still older segments the length may be greater than the width, 1 mm. and 0.6 mm., respectively. Parenchymatous tissue of the body very granular (from which apparently the name punctata of Weinland). Male organs become functional in sixth or seventh segment, female organs in ninth or tenth, uterus becomes functional in eleventh or twelfth segment. Genital pores regularly alternate in the anterior third of the segment. Male and female genital canals pass dorsal of excretory vessels and nerve.

Male reproductive organs.—Testicles (fig. 12, t.) about 18 (12-14 Fuhrmann) in number, oval, maximum size 80 to  $100\mu$ , located in the

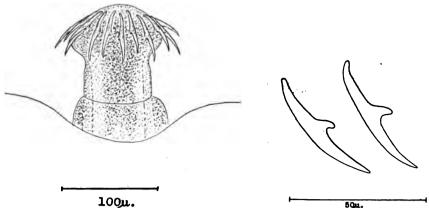

Fig. 10.—Liga brasiliensis: Rostellum, extruded.

Fig. 11.—LIGA BRASILIENSIS:
HOOKS FROM ROSTELLUM.

middle field of the posterior two-thirds of the segment, nine in each lateral half of the segment. Vas deferens (figs. 12, 13, v. def.) forms a mass of coils in the anterior third of the segment, beginning near the median line and extending outward nearly to the genital pore,

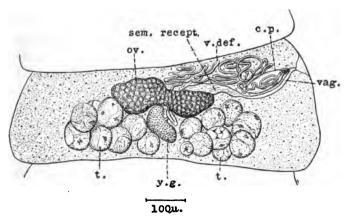

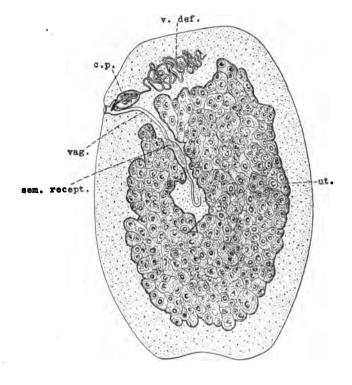

FIG. 12.—LIGA BRASILIENSIS: SEXUALLY MATURE SEGMENT. c. p., CIRRUS POUCH. ov., OVARY. sem. recept., SEMINAL RECEPTACLE. t., TESTICLES. vag., VAGINA. v. def., VAS DEFERENS. y. g., YOLK GLAND.

and also describes a number of coils after entering the cirrus sac. No vesicular enlargements in any part of the vas deferens. Cirrus sac (figs. 12, 13, c. p.) oval, elongated, 80 to  $100\mu$  long by 40 to  $55\mu$  wide. Cirrus 40 to  $50\mu$  long, armed with highly refractile spines,

which in stained specimens are deeply stained and form a conspicuous cone-shaped structure in the cirrus pouch or in the genital cloaca.

Female reproductive organs.—Vagina (figs. 12, 13, vag.) enlarged after crossing the excretory canals, to form a seminal receptacle (figs. 12, 13, sem. recept.), varying greatly in size in different segments. Ovary (fig. 12, ov.) in central portion of segment, sac-like, faintly bilobed, somewhat elongated transversely. Yolk gland (fig. 12, y. g.)

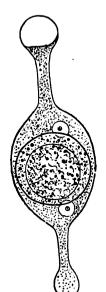

1 mm.

Fig. 13.—Liga brasiliensis: Gravid segment. c. p., Cirrus pouch. sem. recept.,
Seminal receptacle. ut., Uterus. vag., Vagina. v. def., Vas deferens.

about  $100\mu$  in diameter, nearly round, or reniform. Shell gland small, inconspicuous. Gravid uterus (fig. 13, ut.) consists of a thinwalled sac with many small, incompletely separated lobules or outpocketings, filling nearly the entire middle field of the segment excepting a small anterior portion occupied by the vas deferens. Eggs (fig. 14) with a thin outer shell with a tubular process at each

pole terminating in a small globular expansion. Length of outer shell, including processes, 120 to  $125\mu$ ; central portion  $50\mu$  long by 38 to  $40\mu$  wide; diameter of tubular processes 3 to  $4\mu$ , of globular ex-

5Qu.
Fig. 14.—Liga brasiliensis: Egg.

pansion 10 to  $17\mu$ . Inside of the outer shell a second thin, well-defined shell, spherical, 33 to  $36\mu$  in diameter. Oncosphere  $26\mu$  in diameter.

Genus RHABDOMETRA Kholodkovski, 1906.

(For generic diagnosis see p. 86.)

RHABDOMETRA NULLICOLLIS, new species.

Figs. 15-22.

This species has been found in the sagecock (Centrocercus urophasianus) and in the sharptailed grouse (Pedioecetes phasianellus columbianus). The type-specimens (No. 6018, U. S. Nat. Mus.) were collected from the first-named host in Colorado.

#### External anatomy.

The various specimens of this species which have been studied measured 50 to 100 mm. in length by 2 to 2.5 mm. in maximum width. The head (figs. 15, 16) is obtusely pointed anteriorly, 560 to  $650\mu$  wide, about  $360\mu$  thick,

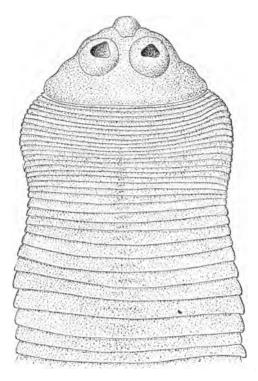

and 280 to  $330\mu$  long, without rostellum. The suckers are 140 to  $160\mu$  in diameter. A neck is absent, segmentation beginning immediately behind the head. The segments are at first of the same width as the head, or slightly wider, and gradually increase in width, finally decreasing again at the posterior end of the strobila. The first segments are less than  $20\mu$  in length, sexually active segments measure  $330\mu$  in length by 1.25 mm. in width, the largest segments measure 1.25 mm. in length by 2 to 2.5 mm. in width, and the final segments 2.8 mm. in length by 1.3 mm. in width. The posterior border of each segment overlaps the anterior end of the following segment only very slightly, and is but slightly wider than the anterior border, so that the segments are nearly quadrate in shape.

The sexual pores are irregularly alternate, located in the anterior third of the segment.

#### Internal anatomy.

Nervous system.—The lateral longitudinal nerves (fig. 18, l. n.) are large and well developed, located in the lateral portions of the segment inside the inner layer of longitudinal muscles.

Musculature.—The longitudinal muscles (fig. 18) are arranged in numerous small bundles disposed in two layers close together, and a considerable distance from the surface of the segment. Dorsoventral

10011.

Fig. 15.—Rhabdometra nullicollis: Head and anterior portion of strobila.

fibers are numerous. Transverse fibers are comparatively few, in relation with the outer and inner sides of the inner longitudinal muscles which they cross at right angles.

Excretory system. — The excretory system is well de-The dorsal (fig. veloped. 18, d. ex.) and ventral canals (fig. 18, v. ex.) are located a considerable distance mediad from the lateral nerves. The ventral canal is much the larger, measuring in places  $80\mu$  in diameter, whereas the dorsal canal measures less than The ventral canals are connected by a transverse canal in the posterior portion of each segment, and also send off anastomosing branches which run among the various organs of the segment, and also form a plexus, which extends later-

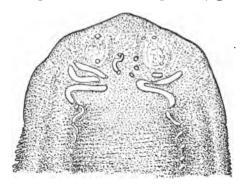

ally on each side of the segment as far as the lateral longitudinal nerve.

The vagina and cirrus pouch pass between the dorsal and ventral excretory canals and dorsal of the lateral nerve.

Male reproductive organs.—The testicles (figs. 17, 18, 20, t.) are about 60 in number, arranged in two layers in the middle field, in the posterior portion of the segment. They measure from 80 to  $100\mu$  in diameter when fully developed. The mass of testicles is hollowed out in front, and this depression is occupied by the female

genital glands. The vas deferens (figs. 20, 21, v. def.) forms a mass of coils in the anterior third of the segment extending from the median line to the base of the cirrus pouch. The cirrus pouch (figs.

17, 19, 21, 22, c. p.) is elongated, broadest near the base and tapering toward its outer end. It measures 350 to 380u in length by 80 to 100u in thickness. It is covered with a layer of muscle fibers interlacing and crossing diagonally, forming a sort of basket work (fig. 19). In the distal three-fifths of the pouch this laver is very thick, but is thin in the proximal or basal portion of the pouch. The cirrus (figs. 19, 20, cir.) is from 250 to 350µ in length, about 10µ in diameter when evaginated. with a lumen about  $2\mu$  in

## 10011

FIG. 16.—RHABDOMETRA NULLICOLLIS: HEAD AND ANTERIOR PORTION OF STROBILA, MEDIAN HORIZONTAL SECTION.

diameter, and is armed with short spines 2 to  $3\mu$  long. A number of slender muscles, which extend from its inner end to attach to the distal portion of the pouch, serve as protractors. The portion of the

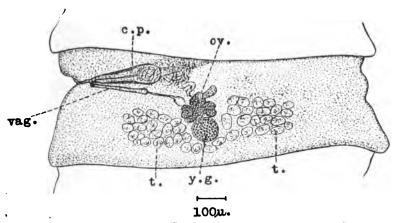

Fig. 17.—Rhabdometra nullicollis: Sexually mature segment.  $c.\ p.$ , Cirrus pouch. or., Ovary. t., Testicles. rag., Vagina.  $y.\ g.$ , Yolk gland.

vas deferens which lies within the cirrus pouch possesses a thick muscular wall. From the base of the cirrus pouch a prominent retractor muscle (fig. 19, retr.) extends diagonally inwards and forwards to the anterior end of the segment near the median line. The

axis of the cirrus pouch is nearly transverse in younger segments, with its inner end slightly tilted forward, but as the segments become older the cirrus pouch becomes more and more oblique.

Female reproductive organs.—The vagina (figs. 17, 18, 20, 21, 22, vag.), which opens into the genital sinus immediately behind the

Deferens. v. ex., Ventral excretory vessel.

male opening, has three distinct portions. The first is very short with a narrow lumen and is surrounded by a spherical muscle bulb 25 to  $30\mu$  in diameter which serves as a sphincter (fig. 20,  $sph.\ vag.$ ). The second portion is 250 to  $300\mu$  long, and possesses a muscular wall by the expansion or contraction of which the size of the lumen may be varied; this portion is lined with closely set cilia-like projections

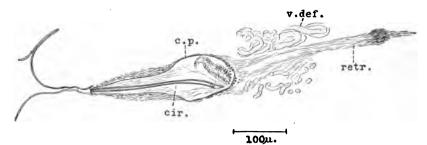

FIG. 19.—RHABDOMETRA NULLICOLLIS: SECTION THROUGH CIRRUS POUCH. cir., CIRRUS. c. p., CIRRUS POUCH. retr., RETRACTOR OF CIRRUS POUCH. r. def., VAS DEFERENS.

8 to  $10\mu$  long. The third portion has a thin membranous wall, and its lumen is at first very narrow, about  $2\mu$ , but toward its inner end it swells out to form a seminal receptacle (figs. 18, 20, sem. recept.) about  $50\mu$  in diameter and 75 to  $100\mu$  long.

The ovary (figs. 17, 18, ov.) is small, compact, and but slightly lobed. At its maximum of development it does not exceed  $175\mu$ 

in width. It is located about in the center of the segment nearer the ventral than the dorsal surface, and in contact with the inner side of the inner longitudinal muscle layer. Immediately behind

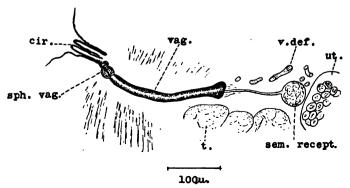

FIG. 20.—RHABDOMETRA NULLICOLLIS: SECTION THROUGH VAGINA, SEMINAL RECEPTACLE, AND EXTRUDED CIRRUS. ctr., CIRRUS. sem. recept., SEMINAL RECEPTACLE. sph. vag., SPHINCTER OF VAGINA. t., TESTICLES. ut., UTERUS. vag., VAGINA. v. def., VAS DEFFRENS.

the ovary is the rounded yolk gland (fig. 17, y. g.) which measures 100 to  $130\mu$  in diameter. Dorsal of the yolk gland is the shell gland slightly smaller. The uterus (figs. 18, 20, 21, 22, ut.) develops im-

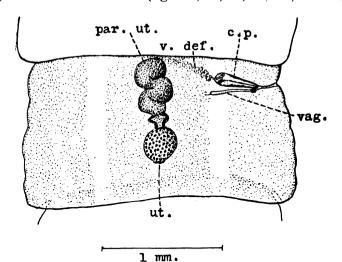

FIG. 21.—RHABDOMETRA NULLICOLLIS: GRAVID SEGMENT. c. p., CIRRUS POUCH. par. ut., PARA-UTERINE ORGAN. ut., UTERUS. tag., VAGINA. v. def., VAS DEFERENS.

mediately in front of and dorsal of the ovary, as a simple sac-like organ. As the uterus develops, growing anteriorly and posteriorly, the ovary disappears. The parenchyma in front of the uterus becomes dense and fibrous, and develops into a prominent para-

uterine organ (figs. 21, 22, par. ut.) which behind is in immediate relation with the anterior end of the uterus. The para-uterine organ when fully developed extends forward to the anterior end of the segment in a slightly tortuous course. Its wall is 5 to  $10\mu$  thick, composed in large part of muscular elements, and its cavity before the eggs pass forward into it from the uterus is filled with a finely fibrous mass. The eggs are oval, with a thin outer membrane 36 to  $40\mu$  in diameter, a thicker middle shell 24 to  $27\mu$  in diameter, and

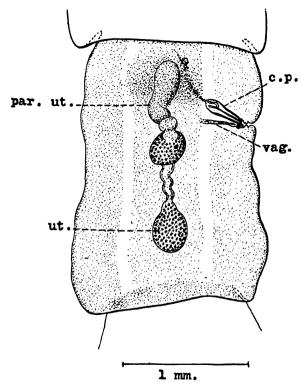

Fig. 22.—Rhabdometra nullicollis: Gravid segment. c. p., Cirrus pouch. par. ut., Para-uterine organ. ut., Uterus. vag., Vagina.

a thin inner membrane closely enveloping the oncosphere, which measures  $18\mu$  in diameter. When the eggs first enter the uterus they are surrounded by a single membrane, the others developing later.

#### RHABDOMETRA SIMILIS, new species.

#### Figs. 23-26.

This species is based on specimens (from the collection of H. B. Ward, deposited in the U. S. National Museum Helminthological Collection, No. 7236) collected from a rain crow (*Coccyzus americanus*) in Nebraska. No heads were present in this material, but the

anatomy of the strobila shows the affinities of this species with the genus Rhabdometra.

#### External anatomy.

The length of this species, so far as could be judged from the specimens examined, which were broken into small pieces, is about 75 mm. The maximum breadth of the strobila is 1.5 mm. The first segments are very short (80  $\mu$ ) and about 0.5 mm. broad, the oldest segments slightly longer than broad, 0.95 to 1 mm. long by 0.85 to 0.95 mm. broad. The posterior border of each segment overlaps the anterior portion of the following segment only very slightly. The segments are nearly as broad at the anterior border as at the posterior border and are hence nearly quadrate in shape.

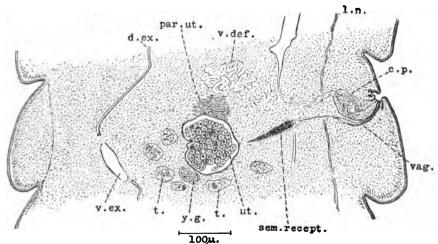

FIG. 23.—RHABDOMETRA SIMILIS: SEXUALLY MATURE SEGMENT BECOMING GRAVID, HORIZONTAL SECTION. c. p., CIRRUS POUCH. d. ex., DORSAL EXCRETORY VESSEL. l. n., NEBVE COBD. par. ut., Para-uterine organ. sem. recept., Seminal receptacle. t., Testicles. ut., Uterus. vag., Vagina. v. def., Vas deferens. v. ex., Ventral excretory vessel. y. g., Yolk gland.

The genital pores are irregularly alternate, located in the anterior half of each segment.

#### Internal anatomy.

Nervous system.—The usual lateral longitudinal nerves (fig. 24, l. n.) are present and are located a short distance beyond the most lateral bundles of the inner longitudinal muscle layer, and inside of the outer longitudinal layer, about equidistant from the lateral border of the segment and the longitudinal excretory canals.

Musculature.—The longitudinal muscles are arranged in two layers, an outer layer of numerous small bundles and an inner layer of larger bundles which are far apart and not over 20 to 24 in number.

Dorso-ventral fibers are fairly numerous throughout the segment, but transverse fibers are not present.

Excretory system (figs. 23, 24, d. ex., v. ex.).—In sexually active segments the ventral excretory canals measure from 25 to  $50\mu$  in

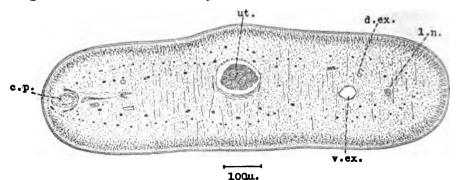

FIG. 24.—RHABDOMETRA SIMILIS: SEXUALLY MATURE SEGMENT, BECOMING GRAVID, TRANSVERSE SECTION. c. p., CIRRUS POUCH. d. ex., DORSAL EXCRETORY VESSEL. l. n., NERVE CORD. ut., UTERUS. v. ex., VENTRAL EXCRETORY VESSEL.

diameter, the dorsal canals 8 to  $10\mu$ . The latter are located dorsal of the ventral canals in about the same vertical longitudinal plane. In the posterior portion of each segment the ventral canals are connected by a transverse canal.

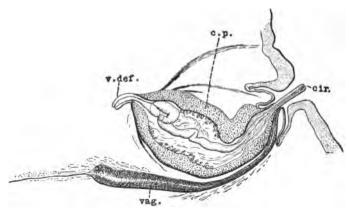

FIG. 25.—RHABDOMETRA SIMILIS: SECTION THROUGH CIRRUS POUCH AND VAGINA. cir., CIRRUS. c. p., CIRRUS POUCH. vag., VAGINA. v. def., VAS DEFERENS.

100u.

The vagina and vas deferens pass between the excretory canals and dorsal of the lateral nerve.

Male reproductive organs.—The testicles (fig. 23, t.), numbering 16 to 20, are located in the posterior third of the segment, are oval in

shape, and measure about  $50\mu$  in diameter. The vas deferens (fig. 23,  $v.\ def$ .), formed by the junction of efferent canals from the testicles, extends forward near the median line to the anterior end of the segment, then turns and passes outward and backward in a tortuous course toward the cirrus pouch. The cirrus pouch (figs. 23, 24, 25,  $c.\ p.$ ) is comparatively small, measuring but 80 to  $90\mu$  in length by  $40\mu$  in diameter. The outer muscular wall is rather thick (8 to  $10\mu$ ) compared to the size of the pouch. The cirrus pouch is not supplied with a retractor muscle, but numerous muscle fibers extend from

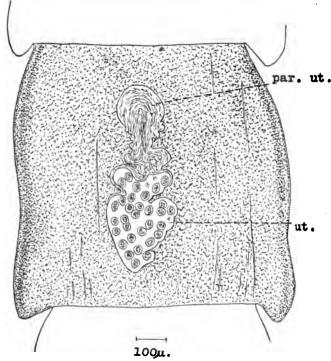

FIG. 26.—RHABDOMETRA SIMILIS: GRAVID SEGMENT. par. ut., PARA-UTERINE ORGAN. ut., UTERUS.

the base of the pouch outward to attach to the cuticula surrounding the genital pore. The cirrus (fig. 25, cir.) in the retracted condition is very slender  $(2\mu)$  and is apparently without spines. When evaginated it measures about  $4\mu$  in diameter.

Female reproductive organs.—The vagina (figs. 23, 25, vag.), which opens into the genital cloaca immediately behind the cirrus, is at first rather thick-walled. It has no definite sphincter. Before crossing the lateral nerve the vagina becomes a thin-walled tube with narrow lumen, and after passing the excretory canals is dilated to form

3264-Bull. 69-09-3

an elongated seminal receptacle (fig. 23, sem. recept.) which extends first inward toward the median line, and then diagonally backward and inward toward the female glands, which are located in the median line close to the posterior border of the segment.

The ovary, which is very small and compact, measures about  $100\mu$  in diameter and is near the median line in the ventral half of the segment near the posterior border. Ventral of the ovary is the yolk gland, about  $80\mu$  in diameter. A definite shell gland was not seen.

The uterus (figs. 23, 24, 26, ut.) develops immediately in front of the ovary in the median line. It is a simple sac-like organ slightly irregular but somewhat spherical in shape. In front of the uterus the parenchyma becomes modified to form a para-uterine organ (fig. 26, par. ut.) with bulbous anterior end, which extends forward in the median line nearly to the anterior border of the segment. The contents of this organ before the eggs have entered it present the usual fibrous appearance.

The eggs, which are oval in shape, have three membranes, an outer one, very thin, about  $45\mu$  in diameter, a thicker prominent middle membrane 30 to  $38\mu$  in diameter, and a thin inner membrane closely investing the oncosphere, which measures 25 to  $30\mu$  in diameter.

## Genus ANONCHOTÆNIA Cohn, 1900.

(For generic diagnosis, see p. 86.)

ANONCHOTÆNIA GLOBATA (Linstow, 1879).

Fig. 27.

Some specimens of tapeworms (No. 3027, Helminthological Collection, Bureau of Animal Industry) collected in Maryland from *Dendroica striata* and others (No. 5955, Helminthological Collection, U. S. Nat. Mus.) collected in Maryland from *Melospiza melodia* agree very closely with the published descriptions of *Anonchotænia globata*, and I have accordingly identified them as belonging to this species.

#### External anatomy.

The length of these specimens is from 20 to 30 mm., and the maximum breadth is about 1 mm. The head is rounded, without rostellum, and measures 500 to  $650\mu$  in diameter. The suckers are about  $230\mu$  in diameter. Cohn (1901b) states that a neck is absent, segmentation beginning immediately behind the head. In the specimens which I have examined, however, there is an unsegmented region immediately behind the head measuring 0.6 mm. in width by 1.5 to 2 mm. in length. Fuhrmann (1908c, p. 625) has also noted that the neck is relatively long. The first segments are very short; the final segments nearly as

long as broad. The genital pores are irregularly alternate at about the middle of the segment. The genital sinus is deep and narrow.

### Internal anatomy.

The ventral excretory canals are connected in the posterior portion of each segment by a transverse canal.

The longitudinal muscles are arranged in two concentric layers, the inner layer (int. musc.) consisting of about 50 bundles, the outer (ext. musc.) of more numerous smaller bundles. Well-defined transverse fibers are present just inside the inner longitudinal layer. Dorsoventral fibers are very weakly developed.

The sexual canals pass on the ventral side of the excretory vessels and the nerve.

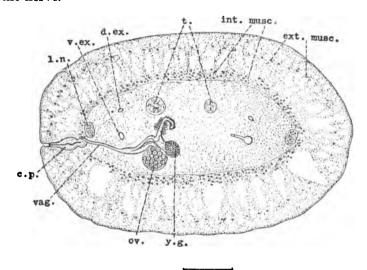

FIG. 27.—ANONCHOTÆNIA GLOBATA: SEXUALLY MATURE SEGMENT, TRANSVERSE SECTION. c. p., CIRRUS POUCH. d. ex., DORSAL EXCRETORY VESSEL. ext. musc., Outer Longitudinal Muscles. int. musc., Inner Longitudinal Muscles. l. n., Nerve cords. ov., Ovary. t., Testicles. vag., Vagina. v. ex., Ventral excretory vessel. y. g., Yolk gland.

1001.

Male reproductive organs.—The testicles (t.) are five in number located toward the dorsal surface in the anterior portion of the segment. They measure when fully developed 30 to  $40\mu$  in diameter. The vas deferens is somewhat tortuous, without, however, forming a mass of coils, and is without vesicular enlargements. The cirrus pouch  $(c.\ p.)$  broadest at the base and tapering toward the end, measures from 70 to  $80\mu$  in length by  $25\mu$  in diameter. Cohn describes the cirrus pouch as short, club-shaped, and "recht muskulös." In my specimens the outer wall of the pouch is thin, with weakly developed musculature.

Female reproductive organs.—The vagina (vag.) passes inwards parallel with the cirrus pouch, and in older segments after crossing the excretory canals dilates to form a small seminal receptacle.

The volk gland (y, q) is spherical about  $40\mu$  in diameter located in the posterior part of the segment about in the median line. ovary (ov.) is a simple sac-like organ, spherical in shape, about 60u in diamater, and is in close relation with the volk gland on the side toward the genital pore and closer to the ventral surface than the volk gland. The uterus develops immediately in front of and dorsal of the ovary and becomes a rounded simple sac-like organ. In front of the uterus and in immediate relation with it a para-uterine organ develops. The outer wall of the para-uterine organ is made up of fibers running in a circular direction. Its contents have in some cases a granular, in others a finely fibrous appearance. The uterus and para-uterine organ, before the eggs have left the uterus, together form an ovoid structure occupying most of the median field of the segment. In the specimens which I have examined, this structure is placed diagonally in the segment, the uterus posterior toward the side of the segment on which the genital pore is located, and the para-uterine organ toward the opposite anterior corner, except in contracted segments, in which the axis of uterus and para-uterine organ may be transverse.

The eggs are few in number and spindle shaped. The oncosphere measures from 20 to  $25\mu$  in diameter. It is surrounded by two membranes, an inner membrane prolonged at each pole into a long, slender process, with finely granular contents and an outer membrane 30 to  $36\mu$  in diameter, prolonged at each pole into a long pointed process, wihin which lies the prolongation of the inner membrane.

# Genus HYMENOLEPIS Weinland, 1858.

(For generic diagnosis see p. 91.)

# HYMENOLEPIS CANTANIANA (Polonio, 1860) Ransom, 1909.

Figs. 28, 29.

Tania cantaniana Polonio, 1860b, pp. 21-22. (Parainea) cantaniana (Polonio) Blanchard, 1891t, pp. 439-440. Davainea oligophora Magalhães, 1898c, pp. 445-449, figs. 1-6. Davainea cantaniana (Polonio) Railliet and Lucet, 1899a, p. 146.

This species, which occurs in turkeys, chickens, pheasants (*Phasianus colchicus*), and peafowls (a host hitherto unrecorded), is one concerning which there has been considerable discussion.

It was originally described by Polonio (1860b, pp. 21-22). His description translated reads as follows:

T. cantaniana Polonio. Head globose, umbonate in the center; suckers placed at equal intervals about the major circumference of the head; neck absent;

body increased in size posteriorly, with the first segments campaniform, following segments campaniform trapezoidal imbricate; genital pores marginal. Length, 13 mm.

Habitaculum: Meleagris gallopavo, intestine, October, Padua (Polonio).a

In a second paper Polonio (1860a, p. 221) gave a figure of the species.

Blanchard (1891t, pp. 439-440) looked upon this form as a possible member of the genus *Davainea*, and from Polonio's figure deduced the following characters:

Suckers large and round; the head seems to be surmounted by a very short rostellum, probably retractile. The neck is quite long, distinctly separated from the head. Segments number about 60. The genital pores are unilateral; cirrus pouch is visible in the twenty-sixth to the forty-fifth segment; the forty-sixth to sixtieth segments are filled with eggs, which, so far as may be judged from the figure, are scattered and isolated as in *Davainea proglottina*.

Stiles (1896f, p. 57) considers that Polonio's description and figure are insufficient to allow the recognition of the species, and would therefore ignore the species entirely.

In 1898 Magalhães (1898c, pp. 445-449, figs. 1-6) described as a new species *Davainea oligophora*, a tapeworm found in chickens in Brazil. His description may be summarized as follows:

Length, 1.73 to 3.2 mm.; width, 170 to 390µ. Head relatively large, 85 to  $108\mu$  long by 51 to  $108\mu$  wide, with a small rostellum armed at its base with a crown of numerous small hooks, which are very instable and usually absent. The form of these hooks is that of a hammer with recurved beak. The suckers are almost circular, slightly elliptical, measuring 61 to 72µ in longitudinal diameter by 43 to 54 \mu in transverse diameter. They are armed with three to four circular rows of little hooks, which are very instable. The neck is short, at times even lacking, and measures 16 to 18µ long by 51 to 90u wide. The segments number from 45 to 75, much wider than long, with posterior borders somewhat longer than the anterior bor-The length of the segments gradually increases from  $20\mu$  in the first segments to 100u in the final segments, and the width from 80 to  $100\mu$  in the first segments to 300 to  $390\mu$  in the final segments. The sexual pores are unilateral, located one in the anterior portion of each segment. The cirrus is very small, cylindrical, apparently provided with few small spines. A seminal vesicle [misinterpretation of the seminal receptacle] is very apparent in the posterior half

<sup>&</sup>lt;sup>a</sup> T. cantaniana Polonio. Caput globosum, centro umbonatum; acetabulis cruciatim oppositis ob majorem capitis circulum; collum nullum; corpus retrorsum dilatatum, articulis supremis campanæformibus, sequentibus campanæformibus imbricatis trapezoidalibus; aperturæ genitales marginales. Long. 0.013. Habitaculum: Melcagris gallopavo, in intestina. Octobri, Patavi (Polonio).

of the strobila, especially in the last 15 to 25 segments. This organ, which is located in the region of the genital pore, is ampulliform, ellipsoidal, and filled with spermatozoa; from it may be traced the long sinuous vas deferens. The last three to eight segments contain fully developed eggs, which are few in number. They seem to be scattered in the parenchyma or contained in a cavity which has pushed aside the parenchyma, and they so fill the segment that no other structures are visible except the seminal vesicle [receptacle]. They are spherical, with three envelopes, and measure 45 to  $50\mu$  in diameter. The outer membrane is smooth and transparent; between it and a second membrane of double contour is a granular mass. The third membrane is that which immediately surrounds the oncosphere. The oncosphere measures 25 to  $30\mu$  in diameter; its hooks,  $18\mu$  in length; the diameter of the second membrane is  $32\mu$ .

Railliet and Lucet (1899a, pp. 144–146) have reported the discovery of tapeworms in turkeys which they consider identical with Tenia cantaniana. These worms present the following characters: Length, 1.9 to 3.2 mm.; maximum width, 200 to  $320\mu$ . Strobila consists of 50 to 88 segments. Eggs fully formed in the last 6 to 8 segments, also apparent in less fully developed condition in preceding segments, so that the last 15 to 18 segments may be looked upon as gravid. The eggs are spherical with three envelopes, the internal and external one the thicker. The external envelope has a diameter of 54 to  $57\mu$ , the middle 39 to  $42\mu$ ; the internal one surrounding the oncosphere is 29 to  $30\mu$  in diameter. The hooks of the oncosphere are 12 to  $13\mu$  in length.

These authors are of the opinion that  $Davainea\ oligophora\ Magalhães$  is identical with  $Tania\ cantaniana\ Polonio$  in view of the striking similarity of the figures of Polonio and Magalhães.

Magalhães (1899b, pp. 480-482) refused to accept the view of Railliet and Lucet on the ground that Polonio's description is too incomplete to give the species Tania cantaniana any standing. Contrary to the opinions of Stiles and Magalhães, it seems to me that Railliet and Lucet are correct in considering Tania cantaniana a recognizable species, and I believe that the forms which I have studied are sufficiently similar to Polonio's description and figure to justify their identification as Tania cantaniana. They also agree so closely with Magalhães's description of Davainea oligophora that there is little doubt of their identity with that species.

The lack of hooks in all specimens which I have examined is one point of difference from *Davainea oligophora*, but as Magalhães found hooks in but few cases and states that they are very instable and usually absent, this difference is not very remarkable. In other respects the head is entirely like that of *Davainea oligophora*, though I have found it slightly larger than described by Magalhães. There

is almost perfect correspondence in the characters of the strobila so far as may be determined from Magalhães's description. The structure which Magelhães interprets as a seminal vesicle corresponds to the seminal receptacle in my specimens. The eggs of the two forms agree in size, number, arrangement, and in all respects except the size of the hooks of the oncosphere, a difference which, on account of the small size of these structures and the consequent liability of error in measurement, can not be considered of great importance.

The species which I have identified as  $Tania\ cantaniana$  has been found several times in this country in chickens and once in a peafowl. After brief study it became evident that it belonged in the genus Hymenolepis and not in Davainea, where it has been commonly placed. The following description is based on specimens in the collection of the Bureau of Animal Industry, Nos. 4109, 4198, 4569, 14554, and 14814 from chickens, Maryland and District of Columbia, No. 14423 from a peafowl, District of Columbia, and No. 2761, collected from a turkey in France by Railliet and determined by him as  $Tania\ cantaniana$ .

#### External anatomy.

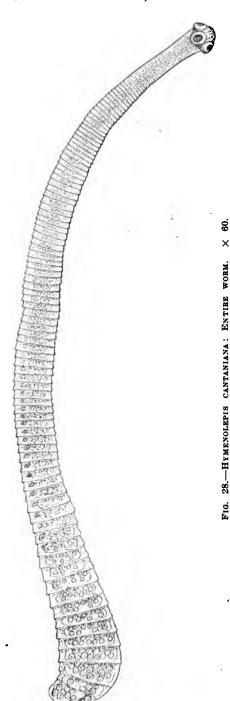

The specimens (fig. 28) which I have examined vary in length from 2 to 12 mm. The maximum breadth is about 0.4 mm. The head measures 120 to  $160\mu$  in width and thickness, by 100 to  $120\mu$  in length.

The rostellum is rudimentary, an elongated sac-like structure in the central axis of the head,  $80\mu$  long by  $35\mu$  in diameter, into the anterior end of which is a deep, narrow invagination with cuticular lining 30 to  $40\mu$  in depth by 4 to  $6\mu$  in diameter.

The suckers measure 60 to  $70\mu$  in diameter. In none of the specimens studied, including some which were very young and immature, was there any trace of hooks either upon the rostellum or suckers. The neck is 80 to  $90\mu$  wide by 100 to  $130\mu$  long.

The width of the strobila gradually increases from the neck toward the posterior end, near which it reaches the maximum.

The segments are considerably broader than long throughout the strobila, the posterior angles project but slightly, and there is no overlapping of the posterior border of one segment over the anterior portion of the next following segment. A strobila 6.5 mm. long consisted of about 100 segments, of which the posterior 13 contained fully developed eggs. In the widest portion of this strobila the segments measured  $80\mu$  in length by  $250\mu$  in width. A strobila 8 mm. in length consisted of about 215 segments, of which the posterior 16 contained fully developed eggs. In the widest portion of this strobila the segments were 60 to  $70\mu$  long and  $300\mu$  wide. Segments

2.5 mm. behind the head in which the male organs had just reached the functional stage measured  $30\mu$  in length by  $120\mu$  in width.

The genital pores are unilateral on the right-hand margin of the strobila, located slightly in front of the middle of each segment.

Internal anatomy.

The cirrus pouch and seminal vesicle are dorsal of the excretory vessels.

Male reproductive organs.— The testicles are three in number, dorsally located one on the right-hand side and two on the left-hand side of the segment. They reach a maximum size of  $25\mu$  in diameter. A seminal vesicle is present in the anterior portion of the segment near the median line; it attains a size of 25 to  $45\mu$  in diameter.

The cirrus pouch is elongated, tapering toward outer end, and measures 75 to  $95\mu$  in length by 12 to  $18\mu$  in diameter. Its inner end is near the anterior border of the segment and extends beyond the median line in the younger segments. The outer wall of the pouch is thin without definite muscle elements. Within the pouch the vas deferens is enlarged to form a seminal reservoir, which occupies more or less of the cavity of the pouch.

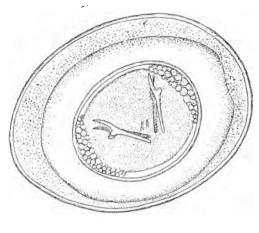

Female reproductive organs.—In sexually mature segments the vagina is swollen to form a prominent seminal receptacle located near the right-hand border of the segment ventral of the cirrus pouch, oval in shape, and attaining a maximum of 30 to 35 u by 45 to 50u in width and length.

The ovary when fully developed is transversely elongated, extending laterally as far as the excretory canals and measuring 135u in its longest dimension. It extends forward to the anterior border of the segment, but does not reach the posterior border. In the median line behind the ovary is the small rounded volk gland, which

measures about 20µ in di-

ameter.

The uterus develops as a simple sac on the ventral side of the ovary, and the latter rapidly degenerates after the appearance of the former. When fully developed the uterus occupies practically the entire segment, and as its wall becomes folded inward in various places its cavity is divided into a number of incompletely separated chambers. number of eggs in the gravid segment is small.

50u. FIG. 29.—HYMENOLEPIS CANTANIANA: EGG.

18 to 20, but on account of the large size which they finally attain the cavity of the uterus is fully occupied.

When they first enter the uterus the eggs have but a single thin membrane and measure but 20µ in diameter. Later other membranes are developed, and the egg (fig. 29) in the final stage of development possesses two well-defined shells, an inner one 27 to 35 u in diameter and an outer one 45 to 60 m in diameter. Between the outer and inner shell is an intermediate finely granular layer limited by a very thin membrane internally and externally. The oncosphere measures 22 to 25 $\mu$  in diameter with hooks 13 to 14 $\mu$  in length.

Genus DIORCHIS Clerc, 1903.

(For generic diagnosis see p. 98.)

#### DIORCHIS ACUMINATA (Clerc, 1902) Clerc, 1903.

Diorchis accuminata CLERC, 1903, p. 249 (misprint for D. acuminata).

Tania acuminata CLERC, 1903, p. 283

Specimens of a tapeworm (from the collection of H. B. Ward, deposited in the U. S. National Museum Helminthological Collection,

No. 7237) collected in Nebraska from Fulica americana apparently belong to the species Diorchis acuminata.

### External anatomy.

These specimens measure 35 mm. in length by 0.65 mm. in maximum breadth. The final segments were not yet gravid, and it is consequently evident that the full-grown worm may be considerably larger than indicated by the above figures.

The head (figs. 30, 31) measures  $160\mu$  in length by 225 to  $235\mu$  in width. The rostellum is cylindrical when protruded, slightly broader at the tip than at the base, measuring  $100\mu$  in length by  $50\mu$  in diameter at the base and  $70\mu$  in diameter at the tip. It is armed with 10 hooks (fig. 32), with long dorsal and short ventral root and measuring  $38\mu$  in length, the dorsal root being  $25\mu$  and the prong  $13\mu$  in length. The suckers are about  $80\mu$  in diameter and are armed with minute spines less than  $5\mu$  in length, set close together in diagonal rows covering the entire surface of the sucker

Segmentation begins very close behind the head, and in this region the strobila is of

about the same breadth as the head. The breadth then becomes reduced to about  $150\mu$  and afterwards gradually increases throughout the remainder of the strobila. The segments are broader than long, the largest measuring  $80\mu$  in length by  $650\mu$  in width.

100u.

FIG. 30.—DIORCHIS ACUMI-NATA: HEAD AND AN-TERIOR PORTION OF STRO-BILA.

The genital pores are unilateral. In each segment the pore is located near the middle of the right-hand margin.

#### Internal anatomy.

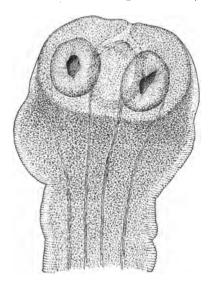

Nervous system.—The lateral longitudinal nerves (fig. 34, l. n.)

are about midway between the lateral borders of the segment and the excretory vessels.

Musculature.—The longitudinal muscles are arranged in two layers. The outer layer (fig. 34, ext. musc.) is composed of numerous small bundles of fibers close to the surface of the segment. The inner layer (fig. 34, int. musc.) consists of eight bundles, as a rule somewhat larger than the outer bundles, and conspicuous only in young segments.

Transverse muscle fibers are well developed only at the junction of the segments. The dorso-ventral fibers are very weakly developed.

Excretory system.—The longitudinal excretory vessels (figs. 34, v. ex., d. ex.; 35, v. ex.) in the older segments are located near the ventral surface on the right-hand

10Qu.

FIG. 31.—DIORCHIS ACUMINATA: HEAD WITH RETRACTED ROSTELLUM.

(pore) side of the segment and near the dorsal surface on the lefthand side. The dorsal vessel is close to and dorsal of the ventral

vessel. The ventral vessels are not connected by transverse vessels.

The cirrus pouch and vagina pass dorsal of the nerve and excretory vessels.

Male reproductive organs.—The testicles (fig. 33, t.) are two in number, located near the dorsal surface in the posterior portion of the segment, one on either side of the median line, and reach a maximum size of 100 to  $130\mu$ . A portion of the vas deferens is swollen to form a seminal vesicle (figs. 33, 34, ves. sem.), which attains a size of 80 to  $130\mu$  in diameter. This seminal vesicle is located in the median line close to the anterior border of the

segment near the dorsal surface.

The cirrus pouch (figs. 33, 34, c. p.) is elongated, extending transversely across the segment. As a rule its inner end does not reach

Fig. 32.—Diorchis acuminata: Hook from Bostellum.

the median line. It measures 180 to  $280\mu$  in length, and 45 to  $55\mu$  in maximum thickness. It is covered with a layer of longitudinal muscles, thickest near the middle and diminishing in thickness toward

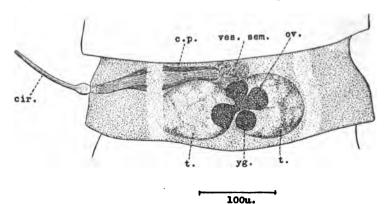

FIG. 33.—DIORCHIS ACUMINATA: SEXUALLY MATURE SEGMENT. cir., CIRRUS. c. p., CIB-RUS POUCH. ov., OVARY. t., TESTICLES. ves. sem., SEMINAL VESICLE. yg., YOLK GLAND.

each end of the pouch. Within the cirrus pouch the vas deferens is swollen to form a seminal reservoir occupying more or less of the cavity of the pouch, according to the quantity of spermatozoa con-

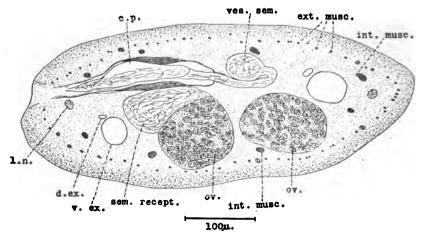

FIG. 34.—DIORCHIS ACUMINATA: SEXUALLY MATURE SEGMENT, TRANSVERSE SECTION. c. p., CIRRUS POUCH. d. ex., DORSAL EXCRETORY VESSEL. ext. musc., OUTER LONGITUDINAL MUSCLES. int. musc., INNER LONGITUDINAL MUSCLES. l. n., NERVE CORD. OV., OVARY. sem. recept., SEMINAL RECEPTACLE. v. ex., VENTRAL EXCRETORY VESSEL. ves. sem.. SEMINAL VESICLE.

tained. The cirrus (figs. 33, 35, cir.) is unarmed; when extruded it measures 6 to  $8\mu$  in diameter, with a globular swelling at its base 14 to  $16\mu$  in diameter. When fully extruded it measures over  $150\mu$  in length.

Female reproductive organs.—The vagina, after crossing the excretory canals, is enlarged to form a seminal receptacle (figs. 34, 36, sem. recept.), which extends inward as far as the inner end of the cirrus pouch.

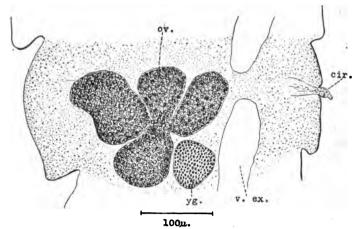

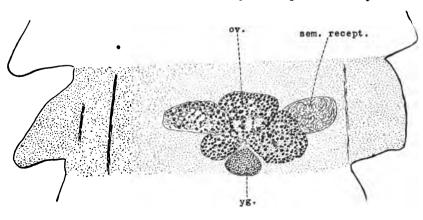

FIG. 35.—DIORCHIS ACUMINATA: SEXUALLY MATURE SEGMENT, HORIZONTAL SECTION. cir., CIRRUS. ov., OVARY. v. ex., VENTRAL EXCRETORY VESSEL. yg., YOLK GLAND.

The ovary (figs. 33-36, ov.) is trilobed, one lobe being anterior and median, the other two lateral; often by a division of the left lateral lobe it becomes four-lobed. When fully developed the ovary extends

10Qu.

Fig. 36.—Diorchis acuminata: Sexually mature segment, horizontal section. ov., Ovary. sem. recept., Seminal receptacle. yg., Yolk gland.

laterally as far as the excretory canals, and the median lobe extends forward to the anterior border of the segment. It is ventral with respect to the testicles.

The yolk gland (figs. 33, 35, 36, yg.) is spherical, 45 to  $60\mu$  in diameter, located in the median line near the ventral surface of the segment, behind the middle of the ovary, in the niche between the right and left lateral lobes.

The uterus was not yet developed in the specimens studied.

#### Remarks.

In certain respects the tapeworm described above is strikingly similar to a form from *Fulica atra* described by Jacobi (1898c, pp. 95–104, pl. 6, figs. 1–16) as *Tania inflata* Rudolphi.

The chief characters of this form, summarized from Jacobi's description, are as follows:

Length 80 to 100 mm., width 2 to 3 mm. Head with a prominent rostellum [similar in shape to that of Diorchis acuminata].armed with a crown of 10 hooks, 23µ long [similar in form to those of Diorchis acuminata. Segments broader than long throughout the strobila. Genital pores unilateral. Longitudinal muscles arranged in two layers of bundles, an outer layer of numerous small bundles close to the surface of the body, and an inner layer of 8 larger bundles [as in Diorchis acuminata. The cirrus pouch and vagina pass on the dorsal side of the longitudinal nerve and excretory vessels. two. Seminal vesicle absent; vas deferens enlarged within the cirrus pouch to form a seminal reservoir. Cirrus pouch with an outer layer of longitudinal muscles [as in Diorchis acuminata]. Size of cirrus pouch a not exactly stated, but it does not extend as far as the median line. Cirrus unarmed; when extruded has a bulbous enlargement at the base [as in Diorchis acuminata], and, to judge from the scale of magnification to which Jacobi's figures are drawn, measures from 6 to  $8\mu$  in diameter, the bulbous enlargement being 12 to  $14\mu$  in diameter. Vagina enlarged to form a seminal receptacle. Ovary trilobed: shell gland spherical, ventral of and posterior of the ovary. The ovary, when fully mature, is about one-fourth as wide as the segment. uterus is a simple sac, which develops on the dorsal side of the ovary and ventral of the testicles. Eggs with two thin shells in addition to a membrane, which closely invests the oncosphere. are drawn out into pointed processes at the poles. Oncosphere 17µ in maximum diameter, outer shell 37 to 41 \mu in length, hooks of oncosphere 9.2 µ long.

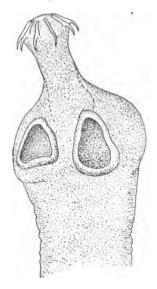

<sup>&</sup>lt;sup>a</sup> Clerc (1903) describes and figures the cirrus pouch in a form from *Fulica* atra which he has identified with Jacobi's species, as very long and extending far beyond the median line. Jacobi, although remarking that the cirrus pouch is very long, distinctly states that it extends almost to the median line, and it is thus shown in his figures. Whether such a wide variation in the size of cirrus pouch may occur, or whether Clerc had before him some other species, are questions which can not be definitely determined until further evidence is available.

In general structure the form from Fulica americana and Jacobi's species are alike, and the cirrus pouch and cirrus in size and shape are practically the same in both. Comparing, however, the length of the hooks of Jacobi's species,  $23\mu$ , with that of the hooks of the form which I have described,  $38\mu$ , and taking into consideration the lack of a seminal vesicle in the former, its presence in the latter, the small size of the fully developed ovary in the former, and the very large size of the ovary in the latter, it seems necessary to look upon these forms as two different species.

Diorchis acuminata, collected from Anas crecca, A. strepera, and Fulica atra, as described by Clerc (1903, pp. 281-284, pl. 8, fig. 13; pl. 9, fig. 25; pl. 11, figs. 78, 88), measures about 80 mm. in length and 1.2 mm. in maximum breadth. The width of the head varies from 230 to 320 u. The rostellum is armed with 10 hooks 27 to 39u in length. The segments are broader than long throughout the strobila, the usual ratio being 14 to 1. Fully developed eggs are present in segments 50 to 60 mm. from the scolex, and the female genital glands are well developed in segments 25 mm. from the scolex. The genital pores are unilateral. The excretory vessels are without commissures in the posterior part of the segment. The longitudinal muscles are arranged in two layers, numerous small bundles in the outer layer, and 8 larger bundles in the inner layer. The vagina and cirrus pouch pass dorsal of the excretory vessels and nerve. There are two testicles present in each segment, reaching their maximum development in segments 15 to 17 mm. from the head. The cirrus pouch measures at its maximum of development 150 to 160u in length. is straight or slightly curved, shaped like a thick spindle, and does not reach the median line of the segment. Its musculature consists especially of longitudinal fibers. The female glands occupy very little space, never exceeding in size one-third of the width of the segment. They are located exactly in the middle of the segment beneath the testicles. The ovary is "double, non lobé, en forme d'haltère recourbé dont les extrémités épaissies sont tournées vers la face dorsale." The volk gland is globular, small, and located between the two wings of the ovary. The vagina is ventral of the cirrus pouch. Its initial portion is muscular, the remainder is swollen, possesses thin walls and acts as a seminal receptacle. The uterus is sac-like. At the beginning of its development it is like a narrow transverse canal. It develops large lobes which penetrate between the longitudinal muscles and beyond the excretory vessels. are elongated in form.

The only differences between the form from Fulica americana and Clerc's species, so far as may be determined from Clerc's description, are in the length of the cirrus pouch (which is slightly greater in the specimens from Fulica americana) and in the shape and size of the

ovary. Although Clerc makes no reference to the presence of spines

on the suckers, this is a feature which is very inconspicuous and may have been overlooked by that author.<sup>a</sup>

The differences mentioned seem to be insufficient to warrant a separation of the two forms, and the identification of the tapeworms from Fulica americana as Diorchis acuminata, accordingly, seems fully justifiable. Fuhrmann (1908a, pp. 7, 81), however considers it improbable that the same species should occur in birds so different as Anserines and Ralliforms, and explains Clerc's record of Diorchis acuminata in Fulica as due to some error, possibly a mistake in labeling. A comparison of specimens is needed to settle the question whether the forms from ducks and Fulica are of the same or different species.

#### DIORCHIS AMERICANA, new species.

#### Figs. 37-42.

100µ.
Fig. 37.—Diorchis americana: Head.

This species, which seems heretofore to have been undescribed, was found in company with *Diorchis acuminata* in *Fulica americana*, and is based on specimens (from the collection of H. B. Ward, deposited in the U. S. National Museum Helminthological Collection, No. 7238), collected in Nebraska.

#### External anatomy.

The length of specimens whose posterior segments were gravid, but in which the eggs had evidently not yet reached their full development, was from 20 to 25 mm. and the maximum width 0.6 mm. The head (fig. 37) measures  $160\mu$  in length by  $250\mu$  in width. The rostellum is similar in shape to that of *Diorchis acuminata* but larger, measuring when fully extended  $135\mu$  in length, by  $50\mu$  in diameter at the base and  $80\mu$  in diameter at the tip, armed with a crown of 10 hooks

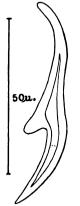

FIG. 38.—DIORCHIS
AMERICANA: HOOK
FROM ROSTELLUM.

(fig. 38) 65µ long, similar in form to those of Diorchis acuminata.

<sup>&</sup>lt;sup>a</sup> Since publishing his description of *Diorchis acuminata* Clerc has informed Fuhrmann (1906b, p. 620) that he has observed that the suckers may be armed.

The dorsal root measures about  $40\mu$  and the prong of the hook about  $25\mu$  in length. The suckers are 100 to  $120\mu$  in diameter, covered over the entire surface as in *D. acuminata* with regularly arranged minute spines less than  $5\mu$  in length.

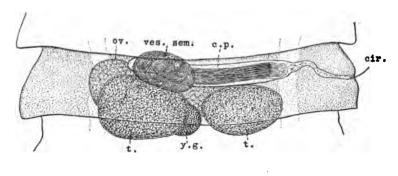

FIG. 39.—DIORCHIS AMERICANA: SEXUALLY MATURE SEGMENT, AT HIGH FOCUS TO SHOW MALE ORGANS, DORSAL VIEW. cir., CIRRUS. c. p., CIRRUS POUCH. ov., OVARY. t., TESTICLES. ves. sem., Seminal vesicle. y. g., Yolk gland.

1001.

As in *D. acuminata*, segmentation begins close behind the head, the width of the strobila at its beginning being about  $160\mu$ . The segments are broader than long throughout the strobila, and near the posterior end measure 110 to  $115\mu$  in length by 500 to  $600\mu$  in width.

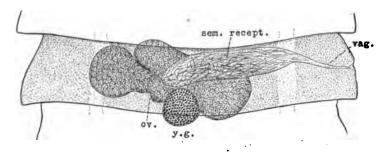

FIG. 40.—DIORCHIS AMERICANA: SEXUALLY MATURE SEGMENT, AT DEEP FOCUS TO SHOW FEMALE ORGANS, DORSAL VIEW. ov., OVARY. sem. recept., Seminal Vesicle. vag., Vagina. y. g., Yolk gland.

The genital pores are unilateral on the right-hand margin of the strobila at about the middle of the segment.

#### Internal anatomy. .

The nervous system, musculature, and excretory system are as described above for *Diorchis acuminata*, and as in the latter the vagina

3264—Bull. 69—09—4

and cirrus pouch pass on the dorsal side of the nerve and excretory vessels.

In this species the segments become gravid much earlier than in the other, as the posterior segments of a strobila 20 mm. long con-

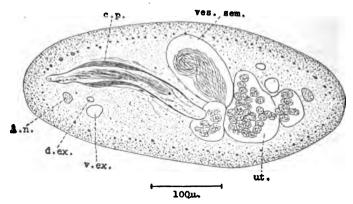

FIG. 41.—DIORCHIS AMERICANA: GRAVID SEGMENT, TRANSVERSE SECTION. c. p., CIRRUS OUCH. d. ex., IDORAL EXCRETORY VESSEL. l. n., NERVE CORD. ut., UTERUS. ves. sem., SEMINAL VESICLE. v. ex., VENTRAL EXCRETORY VESSEL.

tained a well-developed uterus, whereas in *Diorchis acuminata* the uterus had not yet appeared in the posterior segments of a strobila 35 mm. long.

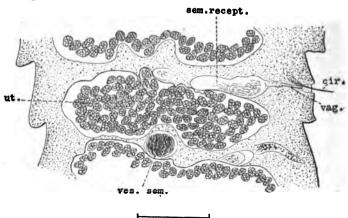

FIG. 42.—DIORCHIS AMERICANA: GRAVID SEGMENTS, HORIZONTAL SECTION. cir., CIRRUS. sem. recept., Seminal receptacle. ut., Uterus. vag., Vagina. ves. sem., Seminal vesicle.

Male reproductive organs.—The testicles (fig. 39, t.), two in number, attaining a maximum size of 100 to  $130\mu$ , are located, as in D. acuminata, in the posterior portion of the segment near the dorsal surface, one on either side of the median line.

In the anterior half of the segment in the median line the vas deferens is swollen to form a prominent seminal vesicle (figs. 39, 41. ves. sem.), 150u or more in diameter. Usually the seminal vesicle is dorsal of, occasionally ventral of, the proximal end of the cirrus pouch. The cirrus pouch (figs. 39, 41, c, p.), usually somewhat curved. extends transversely across the anterior portion of the segment. measuring 250 to 300 u in length by 30 to 40 u in thickness. It is somewhat longer than the cirrus pouch of D. acuminata and usually extends beyond the median line of the segment. As in the latter species, the pouch is covered with a prominent layer of longitudinal muscles, thickest near the middle of the pouch. The vas deferens is enlarged to form a seminal reservoir within the cirrus pouch. sharp contrast to D. acuminata, the cirrus (fig. 39, cir.) is very slender without bulbous enlargement at the base, measuring but 1.5 to 24 in diameter when extruded, whereas in the other species it is from 6 to 8u in diameter, and has a bulbous enlargement at the base 14 to 16u in diameter. As in the latter species, it is unarmed. Its length when fully extruded is at least 100u.

Female reproductive organs.—The vagina (figs. 40, 42, vag.), at first very narrow, becomes swollen beyond the excretory canals to form an elongated seminal receptacle (figs. 40, 42, sem. recept.), which lies against the ventral side of the cirrus pouch and extends as far as the inner end of the latter.

The ovary (figs. 39, 40, ov.), as in D. acuminata, is trilobed with occasionally a fourth lobe on the left-hand side, and when fully developed it extends laterally as far as the excretory canals, and its median lobe reaches the anterior border of the segment. It is located on the ventral side of the cirrus pouch, seminal vesicle, and seminal receptacle. The yolk gland (figs. 39, 40, y. g.) is similar in shape and size to that of D. acuminata and is similarly located.

The uterus (figs. 41, 42, ut.) is a simple sac, without partitions, and develops behind and dorsal of the ovary and ventral of the testicles. As the uterus increases in size and becomes filled with eggs the ovary degenerates and disappears. When fully developed the uterus extends from the posterior to the anterior border of the segment, and laterally beyond the excretory canals on each side, dorsal of the canals on the right side and ventral of the canals on the left side.

The eggs when they first enter the uterus measure 12 to  $15\mu$  in diameter and are closely surrounded by a very thin membrane. Eggs containing fully formed oncospheres were not present in the specimens studied.

#### SYNOPSIS OF THE SUPERFAMILY TÆNIOIDEA.

In the following synopsis I have adopted with a few modifications the arrangement into families recently proposed by Fuhrmann (1907a, 1908a), but instead of giving the group the rank of an order, Cyclophyllidea, I have followed Stiles (1906a) in classing it as a superfamily, Tænioidea. This change from order to superfamily is simply a change in name and rank and in itself does not necessitate any changes within the group. The subordinate groups of the order Cyclophyllidea as arranged by Fuhrmann can be arranged in a similar way in the superfamily Tænioidea, and this is what has been done in the present article, with, however, a number of modifications, the most important of which are as follows:

In his family "Dilepinidæ" Fuhrmann has recognized three subfamilies, "Dilepininæ," Dipylidiinæ, and "Paruterinæ," and has placed in a separate family, "Hymenolepidæ," the genera Hymenolepis, Oligorchis, Diorchis, and Aploparaksis. I have, however, preferred to unite "Hymenolepidæ" with "Dilepinidæ" and "Dilepininæ" with Dipylidiinæ, and accordingly recognize, instead of the two families, one family Hymenolepididæ, with Dipylidiinæ, Hymenolepidinæ, and Paruterininæ (= Paruterinæ Fuhrmann) as subfamilies.

The genus *Stilesia* appears to me much more closely related to the Paruterininæ than to the Anoplocephalidæ, and I have accordingly placed it in the former group.

A number of minor changes, such as changes in names, are noted in their appropriate places. Changes in names have been made in accordance with the International Code of Zoological Nomenclature.

# Superfamily TÆNIOIDEA.

Superfamily diagnosis.—Cestoda: Scolex with four cup-shaped suckers which may exceptionally (Tetrabothriidæ) bear auricular appendages. Apical rostellum present or lacking. Suckers and rostellum may be armed with hooks or unarmed. Neck present or absent. Strobila with well-developed segmentation, or, exceptionally (Fimbriariidæ) without division into segments. A single series or complete or incomplete double series of reproductive organs. Genital pores usually present and marginal, or exceptionally on ventral surface. Testicles usually numerous, in medullary portion of segment. Ovary more or less bilobed. Yolk gland compact, and posterior, dorsal, ventral, or laterad of ovary, rarely (family Tetrabothriidæ) anterior of ovary. Shell gland between ovary and yolk gland. Uterus without special opening to the exterior, except that rarely a secondarily formed opening may be present. Egg (i. e., fertilized egg=

embryo, oncosphere) with one or several membranes; without operculum. Larval stage in vertebrates or invertebrates. Adults in alimentary canal of vertebrates.

Type-family.—Tæniidæ Ludwig, 1886.

#### KEY TO GENERA.

1.	Genital pores marginal or (?) absent2.
	Genital pores ventral, in or near median line; scolex unarmed, without rostellum; a single egg capsule in the gravid segment.
	Mesocestoididæ, Mesocestoides, p. 61.
2.	One cirrus pouch in each segment, or two in each segment, one on either side
	Several cirrus pouches in each lateral half of each segment; segmentation not apparent externally; one testicle, ovary, yolk gland, and uterus in each lateral half of the segment; egg with well-developed pyriform apparatus; head unarmed, without rostellum; adults in marsupials.
	Triplotænia, p. 62.
3.	Vaginal pore anterior of male openingTetracisdicotyla, p. 106.
	Vaginal pore posterior, dorsal, or ventral of male opening, or absent 4.
4.	Anterior portion of strobila enlarged and modified to form a large pseudo scolex; strobila grooved transversely, but without proglottids.
	Fimbriariidæ, Fimbriaria, p. 105.
	Strobila without pseudo scolex; with more or less definite proglottids, or segments 5.
5	Yolk gland in front of ovary; suckers with auricular appendages on an-
o.	terior borderTetrabothride, Tetrabothrius, p. 59.
	Yolk gland posterior, dorsal, ventral, or lateral of ovary; suckers without
	auricular appendages6.
6.	Vaginal pore lacking7.
	Vaginal pore present 15.
7.	Male and female genital openings both (?) lacking; scolex without rostellum; suckers unarmed; a single set of reproductive organs in each segment; female glands near one side of the segment; cirrus pouch rudimentary, unites with distal end of vagina in lateral field of segment
	Male genital opening present8.
8.	Scolex with armed rostellum; segments with lateral appendages; accessory female genital canal present, functioning as vagina, with dorsal, ventral, or marginal opening9 (Amabiliidæ). Scolex with or without rostellum; segments without lateral appendages; vagina, without external opening, functions as seminal receptacle.
	11 (Acoleidæ).
9.	A double set of male reproductive organs and a single set of female organs in each segment; two male genital pores in each segment, one on each side; opening of accessory vagina ventralAmabilia, p. 103.
	A single set of reproductive organs in each segment; male genital pores regularly or irregularly alternate
10.	Suckers and posterior portion of head covered with minute spines; segments of strobila not numerous; testicles few; vagina of each segment turns backward into and communicates with the seminal vesicle of the next

<sup>&</sup>lt;sup>a</sup> The genus Copesoma (p. 106) is not included in this key.

	following segment; an accessory vagina in the opposite side of the segment from the cirrus pouch, sometimes with marginal openingTatria, p. 104.
	Rostellum very large; suckers and posterior portion of head without spiny armature; testicles numerous, extend across entire width of segment;
	vagina absent; accessory vagina dorso-ventral, with median opening on dorsal and ventral surfaces of segmentSchistotænia, p. 104
11	Diœcius, entire strobila male or female; male with a double set, female with
11.	a single set of reproductive organs in each segmentDioicocestus, p. 103.
	Monœcius12
12.	A single set of reproductive organs in each segment13
	A double set of male reproductive organs and a single set of female repro-
	ductive organs in each segment, with two vaginæ functioning as large
	seminal receptaclesDiplophallus, p. 102
13.	Scolex with armed rostellum14
	Scolex without rostellum, but with apical papilla; cirrus conical in shape
	armed with large hooksShipleya, p. 103
14.	Rostellum armed with a single crown of hooks arranged in a zigzag row
	having right angles; testicles few; seminal receptacle very small; uterus
	with dorsal and ventral openingsGyrocælia, p. 102
	Testicles numerous; seminal receptacle very large; uterus without opening
	to the exteriorAcoleus, p. 102.
15.	Scolex with rostellum armed with a double row (rarely a single or triple
	row) of very numerous (and generally very small) hammer-shaped hooks
	i. e., with long ventral root, very short dorsal root, and short blade;
	suckers usually armed16 (Davaineidæ).
	Scolex with rostellum armed with hooks not hammer shaped, without rostellum or with mudimentary may made negatily metallum a special armed 21.
10	tellum, or with rudimentary unarmed rostellum; suckers usually armed_ 21. Rostellum broader than rest of scolex; suckers armed only near anterior
10.	border; a single set of reproductive organs in each segment; uterus sac-
	like, persistentOphryocotyle, p. 67.
	Rostellum not broader than rest of scolex; suckers armed with several
	rings of hooklets around the periphery or unarmed; a single or double
	set of reproductive organs in each segment; uterus not persistent, re-
	placed by egg capsules, with or without the formation of para-uterine
	organs 17.
17.	Uterus breaks down into numerous egg capsules, each containing one or
	more eggs; para-uterine organs not present 18.
	A para-uterine organ present, into which the eggs pass, and which trans-
	forms into an egg capsule 20.
18.	A single set of reproductive organs in each segment19.
	A double set of reproductive organs in each segment; eggs become inclosed
	singly in egg capsulesCotugnia, p. 69
19.	Rostellum armed with a double or single row of hooks; dorsal excretory
	vessels present; genital pores unilateral or irregularly alternate; egg capsules contain one or several eggsDavainea, p. 67.
	Rostellum armed with three rows of hooks; dorsal excretory vessels
	absent; genital pores unilateral; female glands on pore side of median
	line, near the ventral excretory vessel; eggs become inclosed singly in
	egg capsulesPorogynia, p. 69.
20	Eggs pass directly from uterus into a para-uterine organ, which trans-
	forms into an egg capsule
	Eggs become inclosed in numerous egg capsules following the disappear-
	ance of the uterus, and finally are pressed into a large anteriorly located
	para-uterine organ which transforms into an egg capsule_Chapmania, p. 70.

21.	Scolex without rostellum, or with rudimentary unarmed rostellum 49.  Scolex with armed rostellum 22.
22.	Rostellum armed with a double crown of large hooks; genital pores irregularly alternate; uterus with median stem and lateral branches; egg with thin outer membrane and thick, brown, radially striated inner shell.  *Tania*, p. 100.
	Egg with thin transparent shells23.
23.	Para-uterine organ present; rostellum armed with a double crown of hooks24.
	Para-uterine organ absent26.
24.	Uterus single25.
	Uterus more or less completely divided into two spherical sacs; hooks of rostellum triangularBiuterina, p. 88.
25.	Uterus much broader than long; para-uterine organ a transversely elongated parenchymatous mass in front of uterus; on pore side of segment the large usually ventral longitudinal excretory vessel is dorsal in position, and the narrow usually dorsal vessel ventral, the position being normal on other sideCulcitella, p. 86.
	Uterus slightly broader than long, crescentic, in front of ovary, or straight.
	near posterior border of segment; para-uterine organ elongated antero-
	posteriorly in front of uterus; position of excretory vessels normal on
	both sides of segmentParuterina, p. 85
26.	Rostellum armed with a single or double row of hooks; suckers armed or unarmed 27.
	Rostellum armed with several rings of rose-thorn hooklets; a double set of reproductive organs in each segment; two genital pores in each segment, one on each side; uterus reticular, later breaking up into egg capsules.
	Dipylidium, p. 84.
27.	A single set of reproductive organs in each segment 28.
	A double set of male reproductive organs and a single set of female organs
	with two vaginæ in each segment; two genital pores in each segment, one
28.	on each side; uterus sac-like, persistentDiploposthe, p. 101.  Uterus persistent
	Uterus breaks down into egg capsules, each containing one or several eggs; rostellum armed with a double or single crown of hooks; genital pores irregularly alternate, rarely unilateral; testicles numerous, behind the female glands or also laterally on both sides of the latter.  Monopylidium, p. 76.
90	Hooks of rostellum arranged in a circular crown
20.	Hooks of rostellum arranged in a zigzag crown; genital canals pass dorsal
	of excretory vessels; uterus very irregularly lobulatedAngularia, p. 83.
30	Crown of hooks single
<b>.</b>	Crown of hooks double41
21	Genital pores unilateral 32
01.	Genital pores alternate 34.
32.	Genital pores subdorsal; testicles few, but more than 4 in each segment;
	eggs fewTrichocephaloides, p. 73.
	Genital pores strictly marginal; testicles numerous or few; eggs numerous,
	or, rarely, few
33.	Base of cirrus provided with one or two pairs of powerful spines lying in
	special pockets; genital canals pass between longitudinal excretory vessels
	,,

	Base of cirrus not provided with spines in special pockets; genital canals
	pass dorsal of excretory vessels36.
34.	Segments numerous, rarely less than 30; neck present; genital pores irregu-
	larly alternate near anterior border of segment; testicles numerous.
	posterior of female glands or also laterally on both sides of the latter;
	uterus a simple sac, or incompletely divided into numerous small com-
	· municating compartmentsChoanotania, p. 74
	Segments less than 30 in number; neck absent; genital pores regularly
	alternate 35.
35.	Testicles in posterior portion of segment; cirrus pouch short.
	Amæbotænia, p. 80.
	Testicles lateral in position toward the pore side of the segment; cirrus
0.0	pouch very long
<b>5</b> 0.	Testicles, 1 to 4 in each segment 37 (Hymenolepidinæ).
97	
οι.	Testicles, 4 in each segment
38	Testicles, 3 in each segment 39 (Hymenolepis).
<b>0</b> 0.	Testicles, 1 or 2 in each segment 40.
20	Entire surface of suckers armed with minute spines, or (generally) un-
υ.	armed; sacculus accessorius usually absentHymenolepis s. str., p. 90.
	Suckers armed on borders and in the middle with small hooklets; sacculus
	accessorius always presentEchinocotyle, p. 98.
40.	Testicles, 2 in each segment; entire surface of suckers armed with minute
	spines, or unarmed; rostellar hooks with long dorsal and short ventral
	roots (or exceptionally with very short dorsal root, and with ventral
	root nearly as long as the blade)Diorchis, p. 98.
	One testicle in each segment; suckers (?) unarmed; rostellar hooks with
	ventral root as long or nearly as long as the blade; strobila small and
	slenderAploparaksis, p. 99.
41.	Genital pores unilateral42.
	Genital pores alternate45.
42.	Root of cirrus with one or two pairs of powerful spines lying in special
	pockets; testicles few; genital canals pass between the longitudinal ex-
	cretory vesselsGryporhynchus, p. 83.
	Spiniferous sacs at base of cirrus lacking 43.
<b>43</b> .	No testicles in front of female glands, but usually very numerous behind and
	at the sides; rostellar hooks with long dorsal and short ventral roots;
	genital canals pass dorsal of excretory vessels and nerveDilepis, p. 71.
	Testicles entirely surrounding the female glands, or limited to the region
	in front of the female glands 44.
44.	Testicles very numerous, entirely surrounding the female glands; cirrus pouch communicating with the genital cloaca by a narrow canal opening
	upon a large papilla; rostellar hooks with a very large dorsal root and
	small hook portionCyclorchida, p. 82.
	Testicles limited to the region in front of female glandsProorchida, p. 82.
45	Testicles scattered throughout entire dorsal portion of medullary paren-
TU.	chyma; ovary and yolk gland surrounded by a ring-like uterus with
	secondary branches; genital canals pass between excretory vessels; longi-
	tudinal musculature in three layersCyclustera, p. 81.
	Testicles, in lateral or posterior portions of segment only 46.
46.	Testicles in lateral portions of segment only 47.
	Testicles in posterior portion of segment only  48

47.	Division of strobila into segments well marked; female glands toward pore side of segment; genital canals pass between the excretory vessels and ventral of the nerve; genital pores irregularly alternate.
	Laterotænia, p. 82.
	Strobila small, division into segments not well marked; scolex large with small rostellum; reproductive glands very small; ovary and yolk gland toward pore side of segment; genital pores irregularly alternate.  Parvirostrum, p. 81.
48.	Genital canals pass between the longitudinal excretory vessels and dorsal
-0.	of the nerve; genital pores irregularly alternate; strobila usually with
	numerous segments; uterus sac-likeAnomotænia, p. 77.
	Genital canals pass dorsal of the longitudinal vessels and nerve; strobila
	with few segments (less than 30); genital pores regularly alternate;
	uterus much lobulated; outer shell of egg with tubular prolongation at
	each pole terminating in a globular expansion
40	A single genital pore in each segment 50.
10.	Two genital pores in each segment, one on each side
50	Para-uterine organs absent 51.
υ.	Para-uterine organs present 62.
51.	Uterus persistent52.
01.	Uterus not persistent, breaks down into numerous egg capsules, each con-
	taining one or more eggs
<b>52</b> .	Three testicles in each segment; rostellum present but rudimentary and
	unarmedHymenolepis s. str., p. 90.
	Testicles more than three in each segment53.
53.	Uterus with median stem and lateral branches; rostellum rudimentary and
	unarmed, or lacking 54.
	Uterus sac-like or reticular, without median stem; rostellum lacking 55.
<b>54</b> .	Female glands in posterior median portion of segment; testicles scattered throughout the medullary parenchyma except the posterior median por-
	tion; egg with a thin outer membrane, and thick brown radially striated
	inner shell; rostellum present but unarmed and rudimentary_Tania, p. 100.
	Female glands in anterior portion of segment; testicles in posterior portion;
	egg with thin transparent shells; rostellum absentCatenotania, p. 84.
<b>55.</b>	A distinct pedunculated prostatic gland near ventral excretory vessel on
	pore side of median line; egg with pyriform apparatus, the horns of
	which are rather short; adults in mammals
	Pedunculated prostatic gland absent56.
96.	Eggs with pyriform apparatus57.
E	Eggs without pyriform apparatus 59.  Uterus a transversely elongated sac with outpocketings anteriorly and pos-
51.	teriorly 58.
	Extreme lateral portions of uterus sac-like, remainder a complicated system
	of irregular lacunæ; testicles near the posterior border of segment ex-
	tending from the excretory vessels of one side to those of the other;
	adults in mammalsSchizotænia, p. 64.
58.	Testicles in anterior portion of segment extending entirely across the median
	field as far as the excretory vessels; adults in birds and mammals.
	Bertiella, p. 62.
	Testicles in median field toward side of segment opposite genital pore; fe-
	male glands in median field toward pore side; adults in mammals.
	Anoplocephala, p. 62.

59.	Testicles in anterior portion of segment extending entirely across the median field as far as the excretory vessels; uterus a transversely elongated sac with numerous outpocketings anteriorly and posteriorly; adukts in birds and mammals
	Testicles mostly in the lateral portions of the segment on both sides of the longitudinal excretory vessels, extending from the anterior to the posterior border of the segment; uterus median, bilobed, with a prolongation posteriorly on each side which crosses the longitudinal excretory vessels, and passes forward laterad of and parallel with the latter; adults in birds
60.	Cortical layer of parenchyma thin; testicles behind and at sides of female
	glands; adults in mammals and reptilesOochoristica, p. 84. Cortical layer of parenchyma very thick; testicles dorsal, scattered through-
-	out the entire length of the segment 61.
61.	Genital pores unilateral; genital canals pass between excretory vessels: female glands between dorsal and excretory vessels on pore side of segment; adults in birds
	Genital pores alternate; genital canals pass ventral of the excretory vessels;
	female glands submedian, only slightly displaced toward pore side of
	segment; adults in monotremes and marsuplalsLinstowia, p. 65.
62.	One testicle in each segment; strobila circular in cross section with segmentation distinct only at posterior end; adults in amphibia.
	Nematotania, p. 88.
	More than one testicle in each segment63.
63.	Uterus transversely elongated, composed of numerous ascon-like pouches,
	each supplied with a para-uterine organ; adults in mamfinals.
	Thysanosoma, p. 66.
	A single and simple or bilobed uterus with a single para-uterine organ in each segment, or two uteri, each with a para-uterine organ 64.
<b>R4</b>	Two uteri in each segment, small, spherical, sac-like, one in each lateral
	half between the dorsal and ventral excretory vessels; testicles rela-
	tively few, in two sets, one in each side of the segment in the neighbor-
	hood of the excretory vessels; ovary small, globose, between the excretory
	vessels on pore side of the segment; adults in mammalsStilesia, p. 89.
	Uterus single and simple or bilobed; adults in birds65.
65.	Testicles dorsal of female glands and toward anterior border of segment; genital canals pass ventral of excretory vessels; uterus simple, sac-like, commonly displaced toward side of segment opposite genital pore.
	Anonchotania, p. 86.
	Testicles in posterior portion of segment, behind the female glands, may
	also extend forward along sides of latter; genital canals pass between excretory vessels 66.
66.	Uterus tubular and elongated longitudinally, or globular, occupying the median line of the segmentRhabdometra, p. 86.
	Uterus when fully developed consisting of two spherical sacs touching in
	the median line and more or less fusedMetroliasthes, p. 87.
67.	Para-uterine organs present68.
00	Para-uterine organs absent 69.
68.	Uterus single, transversely elongated, undulating, composed of numerous ascon-like pouches, each supplied with a para-uterine organ; adults in
	mammalsThysanosoma, p. 66.
	Two small, spherical uteri in each segment, one on either side, between the dorsal and ventral excretory vessels, each with a single para-uterine organ; adults in mammals

69. Uterus not persistent, the eggs becoming isolated in the parenchyma mostly in the lateral fields of the segment, few in the median field; testicles in lateral fields, absent from the median field; adults in reptiles.

Pancerina, p. 85.

Cittotænia, p. 63.

DIAGNOSES OF FAMILIES, SUBFAMILIES, AND GENERA, AND LISTS OF SPECIES OCCUB-BING IN NORTH AMERICAN BIRDS.

Under each genus are listed the species which have been reported as parasites of North American birds, and references are given to articles in which descriptions of these forms may be found. Species which have been collected in this country, and of which I have examined specimens, are indicated by an asterisk, and the names of hosts from which such specimens were collected are indicated in a similar manner. Among the hosts are included a number of species which are not North American, comprising (1) forms which have been introduced, such as the English sparrow and various game birds, (2) forms which are present in this country in the domesticated state, and (3) forms which are represented in the North American fauna by varieties or subspecies.

# Family TETRABOTHRIIDÆ.

Tetrabothridæ Diesing, 1850, in part.

Family diagnosis.—Tænioidea: Scolex unarmed, without rostellum. Suckers with an outwardly projecting auricular appendage on the anterior border. Neck short. Segments of the strobila, with the exception of the hindermost segments, always much broader than long. A single set of reproductive organs in each segment. Genital pores unilateral. Genital cloaca deep. Cirrus pouch small and nearly spherical, united with the genital cloaca by a muscular cloacal canal. Yolk gland in front of the ovary. Eggs with three transparent envelopes. Adults in birds and mammals.

Type-genus.—Tetrabothrius Rudolphi, 1819.

#### Genus TETRABOTHRIUS Rudolphi, 1819.

Amphoterocotyle Diesing, 1863 (type, A. elegans Diesing, 1863).

Prosthecocotyle Monticelli, 1892 (type, Tænia forsteri Krefft, 1871).

Bothridiotænia Lönnberg, 1896 (type, Tænia erostris, Lönnberg, 1889).

Generic diagnosis.—Tetrabothriidæ: With the characters of the family.

Type-species.—Bothriocephalus macrocephalus Rudolphi, 1810.

#### TETRABOTHRIUS ARCTICUS Linstow, 1991.

For description see Linstow, 1901e, pp. 285-286, fig. 42.

Host.—Somateria mollissima.

## TETRABOTHRIUS CYLINDRACEUS (Rudolphi, 1819) Diesing, 1850.

For description see Fuhrmann, 1899b, pp. 872-873 (Prosthecocotyle culindracea).

Hosts.—Rissa tridactyla, Larus hyperboreus, Larus marinus, Larus argentatus, Larus canus, Larus atricilla, Xema sabini, Sterna maxima, Uria troile.

# TETRABOTHRIUS DIOMEDEÆ (Fuhrmann, 1900).

For description see Shipley, 1900c, pp. 557-558, pl. 56, figs. 27-29 (Prosthe-cocotule diomedew).

Host.—Diomedea exulans.

## TETRABOTHRIUS EROSTRIS (Lönnberg, 1889).

For description see Fuhrmann, 1899b, pp. 871-872 (Prosthecocotyle erostris).

Hosts.—Rissa tridactyla, Larus marinus, Larus argentatus, Larus canus, Sterna hirundo, Sterna paradisæa.

#### TETRABOTHRIUS HETEROCLITUS Diesing, 1850.

For description see Fuhrmann, 1899b, p. 874 (Prosthecocotyle heteroclita); 1899c, pp. 648-650, figs. 4-8 (Prosthecocotyle heteroclita).

Hosts.—Puffinus puffinus, Puffinus kuhli, Priocella glacialoides, Daption capensis, Diomedea exulans, Diomedea albatrus.

### TETRABOTHRIUS MACROCEPHALUS Rudolphi, 1819.

For description see Fuhrmann, 1899b, pp. 873-874 (Prosthecocotyle macrocephala).

Hosts.—Gavia stellata, Gavia arctica, Gavia immer, Colymbus auritus.

# TETRABOTHRIUS MONTICELLII (Fuhrmann, 1899).

For description see Fuhrmann, 1899b, p. 870 (Prosthecocotyle monticellii). Host.—Fulmarus glacialis.

## TETRABOTHRIUS PELECANI Fuhrmann, 1908.

For description see Fuhrmann, 1899b, pp. 875-876 (Prosthecocotyle pelecani aquilæ).

Hosts.—Sula leucogastra, ?Fregata aquila.

## TETRABOTHRIUS PORRIGENS Molin, 1858.

For description see Molin, 1861c, p. 237, pl. 5, figs. 18, 19 (Tetrabothrium (Orygmathobothrium) porrigens).

Host.—Nycticorax nycticorax.

#### TETRABOTHRIUS TORULOSUS Linstow, 1888.

For description see Fuhrmann, 1899c, pp. 643-648, figs. 1-3 (Prosthecocotyle torulosa).

Host.—Diomedea albatrus.

# TETRABOTHRIUS UMBRELLA (Fuhrmann, 1899) Fuhrmann, 1908.

For description see Fuhrmann, 1899b, p. 871 (Prosthecocotyle umbrella). Hosts.—Diomedea exulans. Phæbetria nalnebrata.

#### TETRABOTHRIUS, species.

Listed by Fuhrmann, 1908a, p. 136. Host.—Sula bassana.

# Family MESOCESTOIDIDÆ Fuhrmann, 1907.

Mesocestoidinæ Lühe, 1894.

Mesocestoidæ Ariola, 1899.

Family diagnosis.—Tænioidea: Scolex without rostellum or hooks. Suckers unarmed. A single set of reproductive organs in each segment. Genital pores located in the ventral surface of the segment. Vagina opens in front of or beside the cirrus pouch. Eggs in gravid segments inclosed in a single thick-walled egg-capsule. Adults in mammals and birds.

Type-genus.—Mesocestoides Vaillant, 1863.

## Genus MESOCESTOIDES Vaillant, 1863.

Monodoridium Walter, 1866 (type, Tania utriculifera Walter, 1866).

Ptychophysa Hamann, 1885 (type, Tania canis-lagopodis Rudolphi, 1810).

Generic diagnosis.—Mesocestoididæ: With the characters of the family. Adults in mammals and birds.

Type-species.—Mesocestoides ambiguus Vaillant, 1863.

#### MESOCESTOIDES ALAUDÆ Stossich, 1896.

For description see Stossich, 1896a, p. 133.

Host.—Alauda arvensis.

# MESOCESTOIDES PERLATUS (Goeze, 1782) Mühling, 1898.

For description see Mühling, 1898b, pp. 105–108.—Volz, 1900, pp. 156–157. Hosts.—Cerchneis tinnunculus, Aquila chrysaëtos.

## Family ANOPLOCEPHALIDÆ Fuhrmann, 1907.

Family diagnosis.—Tænioidea: Scolex unarmed, without rostellum. Suckers relatively large, unarmed. Neck absent. Segments usually broader than long. A single or double set of reproductive organs in each segment. Genital pores marginal and bilateral, unilateral, or irregularly alternate or (?) absent. Testicles numerous or rarely (Triplotænia) one in each lateral half of the segment. Median axis of female glands lateral of the median axis of the segment. Uterus persistent, and transversely elongated, either tubular, sac-like, branched or reticular; or not persistent, replaced by egg capsules whose formation may or may not be preceded by the appearance of para-uterine organs. Egg with thin transparent shells with or without a pyriform apparatus. Adults in mammals and birds.

Type-genus.—Anoplocephala E. Blanchard, 1848.

#### Subfamily ANOPLOCEPHALINÆ Blanchard, 1891.

Subfamily diagnosis.—Anoplocephalidæ: Uterus persistent and tubular, sac-like, branched or reticular. Adults in mammals and birds

Type-genus.—Anoplocephala E. Blanchard, 1848.

#### Genus TRIPLOTÆNIA Boas, 1902.

Generic diagnosis.—Anoplocephalinæ: Segmentation of strobila not apparent externally. One ovary, yolk gland, and testicle in each lateral half a of the segment, near the border in the neighborhood of the longitudinal excretory vessels and nerve. One vagina in each lateral half of the segment. Four to five cirrus pouches in each lateral half of the segment. Uterus, one in each lateral half of the gravid segment, sac-like, transversely elongated. Egg with well-developed pyriform apparatus, the horns of which are prolonged in two coiled filaments. Adults in marsupials.

Type-species.—Triplotania mirabilis Boas, 1902.

## Genus ANOPLOCEPHALA E. Blanchard, 1848.

Plagiotænia Peters, 1871 (type, Tænia gigantea Peters, 1857).

Generic diagnosis.—Anoplocephalinæ: Segments generally much broader than long, occasionally longer than broad. A single set of reproductive organs in each segment. Genital pores unilateral or irregularly alternate. Genital canals pass on the dorsal side of the longitudinal excretory vessels and nerve. Testicles and female glands in the median field; female glands toward the pore side of the segment, testicles toward the opposite side. Uterus a transversely elongated sac with pocket-like appendages, anteriorly and posteriorly. Eggs with well-developed pyriform apparatus. Adults in mammals.

Type-species.—Anoplocephala perfoliata (Goeze, 1782) E. Blanchard, 1848.

#### Genus BERTIELLA Stiles and Hassall, 1902.

Bertia Blanchard, 1891 (homonym of Bertia Ancey, 1888, mollusk).

Generic diagnosis.—Anoplocephalinæ: Segments always broader than long. A single set of reproductive organs in each segment. Genital pores regularly or irregularly alternate. Genital canals pass dorsal of longitudinal excretory vessels and usually dorsal of nerve.

<sup>&</sup>lt;sup>a</sup> The specimens on which the species *Triplotænia mirabilis* was based each consisted of a head to which apparently two strobilæ were attached. Janicki (1906), however, has shown that this condition is probably teratological, and that the double strobila represents the separated lateral halves of a single strobila.

Testicles dorsal and anterior, extending in an unbroken mass from one side of the median field of the segment to the other as far as the excretory vessels. Uterus transversely elongated with numerous outpocketings, anteriorly and posteriorly. Eggs with or without pyriform apparatus. Adults in birds and mammals.

Type-species.—Bertiella studeri (Blanchard, 1891) Stiles and Hassall, 1902.

# BERTIELLA DELAFONDI (Railliet, 1892).

For description see Stiles, 1896b. p. 57, pl. 20, figs. 257-262 (Twnia, delafondi).—Fuhrmann, 1902i, pp. 132-135, figs. 13, 14 (Bertia delafondi.—Wolffhügel, 1904a, pp. 45-48, figs. 1-4 (Bertia delafondi).

Hosts.—Columba livia, Columba livia domestica.

## Genus ANDRYA Railliet, 1893.

Generic diagnosis.—Anoplocephalinæ: Segments broader than long or as long as broad. A single set of reproductive organs in each segment. Genital pores irregularly alternate, but mostly upon the same side of the strobila. Testicles in median field. A distinct round or elongated pedunculated prostatic gland near ventral excretory vessel on pore side of median field. Female glands in the median field on the pore side of the median line. Uterus net-like, with forked processes, occasionally somewhat sac-like. Eggs with pyriform apparatus, the horns of which are rather short. Adults in mammals.

Type-species.—Andrya rhopalocephala (Riehm, 1881) Stiles, 1895.

## Genus CITTOTÆNIA Riehm, 1881.

Ctenotænia Railliet, 1893 (type, Tænia marmotæ Frölich, 1802). Cælodela Shipley, 1900 (type, Cælodela kuvaria Shipley, 1900; see Fuhr-Mann, 1902i, p. 142).

Generic diagnosis.—Anoplocephalinæ: Segments broader than long. Two sets of reproductive organs in each segment. Genital pores bilateral. Genital canals pass dorsal of longitudinal excretory vessels and nerves. Interproglottidal glands absent. Vagina ventral of cirrus pouch on both sides of segment. Uterus single or double (one on each side of median line), transversely elongated, tubular, generally with simple anterior and posterior outpocketings. Eggs with well-developed pyriform apparatus, the horns of which are long, crossing each other, or in some cases without this apparatus (see Fuhrmann, 1902i, p. 142, Cittotænia kuvaria). Adults in mammals and birds.

Type-species.—Cittotania latissima Riehm, 1881=Cittotania denticulata (Rudolphi, 1804) Stiles and Hassall, 1896,

## Genus MONIEZIA Blanchard, 1891.

Paronia DIAMARE, 1900 (type, P. carrinoi DIAMARE, 1900; see FUHBMANN, 1907a, p. 295).

Generic diagnosis.—Anoplocephalinæ: Segments generally broader than long. Two sets of reproductive organs in each segment with two reticulate uteri which may become more or less fused with one another in the median line. Genital pores bilateral. Genital canals cross on dorsal side of longitudinal excretory vessels and nerves. Interproglottidal glands generally present. Vagina ventral and cirrus dorsal on right side of segment; the reverse on left side. Eggs with three shells and with well-developed pyriform apparatus, the horns of which generally end in a disk, or (in species from birds) without pyriform apparatus. Adults in mammals and birds.

Type-species.—Moniezia expansa (Rudolphi, 1810) Blanchard, 1891.

# Genus SCHIZOTÆNIA Janicki, 1904.

Generic diagnosis.—Anoplocephalinæ: Segments broader than long. A single set of reproductive organs in each segment. Genital pores alternate. Genital canals pass dorsal of the longitudinal excretory vessels and nerve. Testicles near the posterior border of the segment in a group extending from the longitudinal excretory vessels of one side to those of the other. Cirrus pouch very muscular. Female glands almost median, their longitudinal axis but slightly displaced toward the genital pore. Extreme lateral portions of the uterus become functional early as sac-like enlargements; remainder of uterus develops as a complicated system of irregular lacunæ. Eggs with pyriform apparatus. Adults in mammals.

Type-species.—Tania decrescens Diesing, 1856 (not T. decrescens Creplin, 1849).

## Genus APORINA Fuhrmann, 1902.

Generic diagnosis.—Anoplocephalinæ: A single set of reproductive organs in each segment. Genital pores (?) absent. Female glands near the side toward which the vagina runs. Testicles dorsal, very numerous, mostly in the lateral portions of the segment on both sides of the longitudinal excretory vessels, extending from the anterior to the posterior border of the segment; very few in the median field. Vagina and rudimentary cirrus pouch (? without external openings), irregularly alternate on right or left side of the strobila, pass dorsal of the excretory vessels and unite with one another in the lateral field of the segment. Uterus median, bilobed, with a prolongation posteriorly on each side, which crosses the longitudinal excretory vessels,

and passes forward outside of and parallel with the latter. Eggs with two shells without pyriform apparatus. Adults in birds.

Type-species.—Aporina alba Fuhrmann, 1902.

#### Subfamily LINSTOWINÆ Fuhrmann, 1907.

Subfamily diagnosis.—Anoplocephalidæ: A single set of reproductive organs in each segment. Uterus breaks down into egg capsules. Adults in mammals and birds.

Type-genus.—Linstowia Zschokke, 1898.

## Genus LINSTOWIA Zschokke, 1898.

Generic diagnosis.—Linstowinæ: Segments broader than long. Cortical parenchyma greatly increased in thickness, medullary parenchyma correspondingly reduced. Dorsal longitudinal excretory vessels along the outer side of the ventral vessels. Genital pores alternate. Genital canals pass ventral of the excretory vessels and nerve. Testicles dorsal, scattered throughout the entire length of the segment. Female glands submedian, only slightly displaced toward the pore side of the segment. Uterus a thin-walled folded tube, disappearing early, the eggs becoming inclosed singly in egg capsules. Eggs without pyriform apparatus. Adults in monotremes and marsupials.

Type-species.—Tænia echidnæ W. Thompson, 1893.

#### Genus ZSCHOKKEELLA, new name.

Linstowia (in part) (see Fuhrmann, 1902i, p. 138).

Zschokkia a Fuhrmann, 1902.

Zschokkea b Fuhrmann, 1902 (homonymous with Zschokkea Koenike, 1892, o a genus of mites).

Generic diagnosis.—Linstowinæ: Segments much broader than long. Cortical parenchyma and musculature greatly developed. Dorsal excretory vessel lateral of ventral vessel. A fine capillary network in the periphery of the cortical parenchyma connects all four excretory vessels. Genital pores unilateral. Genital canals pass dorsal of the nerve, and ventral of the dorsal excretory vessel. Cirrus pouch weakly developed. Testicles dorsal scattered through the entire length of the segment. Female reproductive glands toward pore side of the segment between dorsal and ventral excretory vessels. Uterus early breaks down into egg capsules. Adults in birds.

Type-species.—Zschokkeella linstowii (Parona, 1885).

a Fuhrmann, 1902i, p. 138, apparently a misprint for Zschokkea.

<sup>&</sup>lt;sup>b</sup> Fuhrmann, 1902i, p. 140.

<sup>·</sup>c Zool. Anz., vol. 15, pp. 320-321.

#### Subfamily THYSANOSOMINÆ Fuhrmann, 1907.

Subfamily diagnosis.—Anoplocephalidæ: Uterus transversely elongated consisting of several or numerous communicating sacs with parenchymatous para-uterine organs, into which the eggs probably pass in the oldest segments. Adults in mammals.

Type-genus.—Thysanosoma Diesing, 1835.

#### Genus THYSANOSOMA Diesing, 1835.

Generic diagnosis.—Thysanosominæ: Segments much broader than long, end segments only showing a tendency to become longer and narrower. A double set of reproductive organs but only a single uterus in each segment, with opposite or with irregularly alternating pores, those of one side, with the corresponding cirrus pouch, ovary, and vagina having been suppressed. Genital canals pass between the longitudinal excretory vessels, and dorsal of the nerve. Uterus transverse, undulating, composed of numerous ascon-like pouches each supplied with a parauterine organ. Horns of pyriform apparatus absent. Adults in mammals (ruminants).

Type-species.—Thysanosoma actinioides Diesing, 1835.

# Family DAVAINEIDÆ Fuhrmann, 1907.

Family diagnosis.—Tænioidea: Scolex with simple rostellum, armed with double row (rarely a single row) of very numerous (and generally very small) hammer-shaped hooks. Suckers armed or, rarely, unarmed. A single or double set of reproductive organs in each segment. Genital pores marginal, and bilateral, unilateral, or irregularly alternating. Uterus sac-like, persistent; or sac-like or branched, not persistent, replaced either by numerous egg capsules, or by a single egg capsule whose formation is preceded by the appearance of a para-uterine organ. Egg with thin transparent shells. Adults in mammals and birds.

Type-species.—Davainea Blanchard and Railliet, 1891.

#### Subfamily OPHRYOCOTYLINÆ Fuhrmann, 1907.

Subfamily diagnosis.—Davaineidæ: Rostellum, very broad, armed with a double row of hooks on border. Surface of suckers armed only near the anterior border. A single set of reproductive organs

<sup>&</sup>lt;sup>a</sup> Fuhrmann (1908a, p. 41) has found that the apical structure, with five depressions, which has been described in different species of *Ophryocotyle*, is really a rostellum with an anterior enlargement which in certain stages of contraction presents the peculiar appearance noticed by various authors.

in each segment. Genital pores irregularly alternate. Uterus saclike, slightly bilobed, persistent. Adults in birds.

Type-genus.—Ophryocotyle Friis, 1870.

## Genus OPHRYOCOTYLE Friis, 1870.

Generic diagnosis.—Ophryocotylinæ: With the characters of the subfamily.

Type-species.—Ophryocotyle proteus Friis, 1870.

# OPHRYOCOTYLE INSIGNIS Lönnberg, 1890.

For description see Lönnberg, 1890b, pp. 15-18.—Blanchard, 1891t, pp. 442-443.—Fuhrmann, 1909, pp. 94-97, figs. 1, 2, 4-6.

Host.—Hamatopus ostralegus.

#### OPHRYOCOTYLE PROTEUS Friis, 1870.

For description see Blanchard, 1891t, pp. 440-442, fig. 20.—Stiles, 1896f, p. 56, pl. 19, figs. 252-255.—Fuhrmann, 1909, fig. 3.

Hosts.—Ægialitis hiaticula, Calidris leucophæa, Erolia ferruginea, Pelidna alvina. Larus canus.

# OPHRYOCOTYLE, species Lönnberg.

Listed by Fuhrmann, 1908a, p. 159.

Host.—Mergus serrator.

#### Subfamily DAVAINEINÆ Braun, 1900.

Subfamily diagnosis.—Davaineidæ: Suckers armed around the periphery with several rings of hooklets which are unstable or persistent. Uterus breaks down into numerous egg capsules, each containing one or more eggs. Para-uterine organs not present. Adults in mammals and birds.

Type-genus.—Davainea Blanchard and Railliet, 1891.

#### Genus DAVAINEA Blanchard and Railliet, 1891.

Bothriotænia, Railliet, 1892 (type, Dibothrium longicolle Molin, 1858; see Lühe, 1899c, p. 40).

Generic diagnosis.—Davaineinæ: A single set of reproductive organs in each segment. Genital pores unilateral or occasionally irregularly alternate. Uterus breaks down into egg capsules each containing one or several eggs. Adults in mammals and birds.

Type-species.—Davainea proglottina (Davaine, 1860) Blanchard, 1891.

#### DAVAINEA ANATINA Fuhrmann, 1908.

For description see Fuhrmann, 1909, p. 107, fig. 16.

Host.—Anas platyrhynchos domestica.

#### \*DAVAINEA CESTICILLUS (Molin, 1858) Blanchard, 1891.

For description see RANSOM, 1905b, pp. 283-285, figs. 8, 14, 18, 26, 32.

Hosts.—\*Meleagris galllopavo domestica, \*Gallus gallus domesticus.

#### DAVAINEA CIRCUMVALLATA (Krabbe, 1869) Blanchard, 1891.

For description see Krabbe, 1869b, p. 343, pl. 10, fig. 295 (*Tænia circumvallata*).—Blanchard, 1891t, p. 434, fig. 10.—Stiles, 1896f, pp. 47-48, pl. 16, figs. 203-211.—Mola, 1907, pp. 126-130, figs. 1-7.

Host.—Coturnix coturnix.

#### \* DAVAINEA COMITATA Ransom, 1000.

For description see Ransom, 1909, pp. 15-18, figs. 5-8 (the present paper). Hosts.—\*Colaptes auratus, \*Melanerpes eruthrocephalus.

## DAVAINEA CRASSULA (Rudolphi, 1819) Railliet, 1893.

For description see Krabbe, 1869b, pp. 345-346, pl. 10, fig. 301 (*Tarnia crus sula*); 1882a, p. 363, pl. 2, figs. 66, 67 (*T. crassula*).—Stiles, 1896f, pp. 53-54, pl. 18, figs. 243-246.—Fuhrmann, 1909, p. 104, fig. 13.

Hosts.—Columba livia, Columba livia domestica.

### \* DAVAINEA ECHINOBOTHRIDA (Mégnin, 1880) Blanchard, 1891.

For description see Ransom, 1904b, pp. 55-65, figs. 42, 44, 46, 48, 50, 52; 1905b, pp. 279-283, figs. 6, 7, 13, 17, 20, 25, 31.

Host.—\* Gallus gallus domesticus.

### DAVAINEA FRIEDBERGERI (Linstow, 1878) Blanchard, 1891.

For description see Stiles, 1896f, pp. 52-53, pl. 18, figs. 236-242.

Host.—Phasianus colchicus.

## (? DAVAINEA) LONGICOLLIS (Molin, 1858).

For description see Stiles, 1896f, pp. 26-27 (Bothriotænia longicollis).

Host.—Gallus gallus domesticus.

#### DAVAINEA MUTABILIS a Rüther, 1901.

For description see RÜTHER, 1901b, pp. 353-357, 362-364, figs. 1-12. Host.—Gallus gallus domesticus.

### DAVAINEA PARAECHINOBOTHRIDA b Magalhães, 1803.

For description see Magalhães, 1898c, pp. 442-443, 444.

Host.—Gallus gallus domesticus.

#### DAVAINEA POLYUTERINA Fuhrmann, 1908.

For description see Fuhrmann, 1909, p. 103.

Host.—Coturnix coturnix.

## \* DAVAINEA PROGLOTTINA c (Davaine, 1860) Blanchard, 1891.

For description see STILES, 1896f, p. 47, pl. 15, figs. 194-198; pl. 16, figs. 199-202.

Host.—\* Gallus gallus domesticus.

### \* DAVAINEA RHYNCHOTA Ransom, 1909.

For description see RANSOM, 1909, pp. 10-15, figs. 1-4 (the present paper).

Hosts.—\*Colaptes auratus, \*Melanerpes erythrocephalus.

### \* DAVAINEA TETRAGONA (Molin, 1858) Blanchard, 1891.

For description see Ransom, 1904b, pp. 55-65, figs. 41, 43, 45, 47, 49, 51; 1905b, pp. 278-279, figs. 5, 12, 16, 19, 24, 30.

Host.—\* Gallus gallus domesticus.

<sup>&</sup>lt;sup>a</sup> This form is probably identical with D. cesticillus.

b This form is perhaps identical with D. echinobothrida or D. tetragona.

<sup>&</sup>lt;sup>c</sup> This species has been collected in this country in Pennsylvania (Bureau of Animal Industry Collection, No. 4372) and in Maryland (Bureau of Animal Industry Collection, Nos. 14442, 14522, and 14759).

DAVAINEA VOLZI a Fuhrmann, 1905.

For description see Fuhrmann, 1905b, pp. 303-308, pl. 10, figs. 1-7.

Host.—Gallus gallus domesticus.

Genus POROGYNIA b Railliet and Henry, 1909.

Linstowia Zschokke, 1898 (in part; see Fuhrmann, 1907a, p. 293).

Polycælia Fuhrmann, 1907 (homonymous with Polycælia King, 1849,
Cælenterata).

Generic diagnosis.—Davaineinæ: Scolex with simple rostellum, armed with three rows of hooks. Segments much broader than long. Cortical parenchyma and longitudinal musculature greatly developed. Dorsal excretory vessels absent. A single set of reproductive organs in each segment. Genital pores unilateral. Genital canals pass dorsal of the longitudinal ventral excretory vessel and nerve. Testicles numerous. Female glands on the pore side of the median line, near the ventral excretory vessel. Yolk gland between the ovary and median line. Uterus with very thin walls, which early disappear. The eggs become inclosed singly in egg capsules, closely packed together filling the medullary parenchyma. Adults in birds.

Type-species.—Porogynia lata (Fuhrmann, 1901).

### Genus COTUGNIA Diamare, 1893.

Generic diagnosis.—Davaineinæ: Segments broader than long. Several layers of longitudinal muscles alternating with layers of transverse muscle fibers. A double set of reproductive organs in each segment, close to the longitudinal excretory canals. Genital canals pass dorsal of longitudinal excretory vessels and nerve. Testicles numerous, filling the median field and extending dorsal of the female organs and excretory vessels to the extreme edge of the medullary parenchyma. Uterus breaks down, and the eggs become inclosed singly in egg capsules. Adults in birds.

Type-species.—Cotugnia digonopora (Pasquale, 1890) Diamare, 1893.

COTUGNIA DIGONOPORA (Pasquale, 1890) Diamare, 1893. For description see STILES, 1896f, p. 30, pl. 1, figs. 1-11.

Host.—Gallus gallus domesticus.

<sup>&</sup>lt;sup>a</sup>This species is very similar to and perhaps identical with *Davainea echino-bothrida*.

<sup>&</sup>lt;sup>b</sup> Fuhrmann (1907a) placed the genus *Polycælia* (=*Porogynia*) in the subfamily Dipylidiinæ, but more recently (1908a, p. 47) in the light of later knowledge concerning the anatomy of its type-species has transferred it to the subfamily Davaineinæ.

### Subfamily IDIOGENINÆ Fuhrmann, 1907.

Subfamily diagnosis.—Davaineidæ: Suckers (?) unarmed. A single set of reproductive organs in each segment. Uterus not persistent, sac-like, more or less lobed or much branched. A para-uterine organ develops into which the eggs finally pass. Adults in birds.

Type-genus.—Idiogenes Krabbe, 1868.

## Genus IDIOGENES Krabbe, 1868.

Generic diagnosis.—Idiogeninæ: Genital pores unilateral. Cirrus pouch very large, with retractor. A para-uterine organ develops in front of the uterus into which the eggs finally pass directly from the latter, and which transforms into a single egg capsule. Adults in birds.

Type-species.—Idiogenes otidis Krabbe, 1868.

### Genus CHAPMANIA Monticelli, 1893.

Capsodavainea Fuhrmann, 1901 (type, Capsodavainea tauricollis (Chapman, 1876) Fuhrmann, 1901).

Generic diagnosis.—Idiogeninæ: Longitudinal musculature greatly developed, consisting of several layers of muscle bundles. Genital pores unilateral. Uterus much branched, disappears, and the eggbecome inclosed in numerous egg capsules, and finally are pressed into a large anteriorly located para-uterine organ, which transforms into a single egg capsule. Adults in birds.

Type-species.—Chapmania tauricollis (Chapman, 1876) Monticelli, 1893.

# Family HYMENOLEPIDIDÆ Railliet and Henry, 1909.

"Hymenolepida" Ariola, 1899 (type-genus, Hymenolepis). Echinocotylida a Ariola, 1899 (type-genus, Echinocotyle).

"Dilepinida" Fuhrmann, 1907 (type-genus, Dilepis).

Family diagnosis.—Tænioidea: Scolex with an armed rostellum, or without rostellum. Hooks on rostellum not hammer-shaped. Suckers usually unarmed. A single, or rarely, a double, set of reproductive organs in each segment. Genital pores marginal and bilateral, unilateral, or regularly or irregularly alternate. Egg with thin transparent shells. Adults in mammals, birds, reptiles, and amphibia.

Type-genus.—Hymenolepis Weinland, 1858.

Subfamily DIPYLIDIINÆ Stiles, 1896.

Rhynchotænia Diesing, 1850. Malacolepidota Weinland, 1858.

<sup>&</sup>lt;sup>a</sup> Echinocotylidæ and Hymenolepidæ are both referred to by Ariola (1809d. p. 166) on the same page, Hymenolepidæ being mentioned first.

Cystoideæ Leuckart, 1863.

Cystoidei Leuckart, 1886.

Cystoidotæniæ Railliet. 1886.

Microtæniæ Claus, 1891.

Dipylidinæ Railliet, 1896. (See Stiles, 1906a, p. 48.)

"Dilepininæ" Fuhrmann, 1907.

Dilepidinæ Railliet and Henry, 1909.

Subfamily diagnosis.—Hymenolepididæ: Rostellum armed, or, rarely, absent. Suckers unarmed. A single set, or rarely a double set, of reproductive organs in each segment. Uterus sac-like, simple or lobulated, or not persistent, breaking down into numerous egg capsules, each containing one or several eggs. Para-uterine organs not developed. Adults in birds, mammals, and reptiles.

Type-genus.—Dipylidium Leuckart, 1863.

### Genus DILEPIS Weinland, 1858.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a double crown of hooks, with long dorsal and short ventral root and long blade. Inner longitudinal muscle layer consisting of numerous bundles. Genital pores unilateral. Genital canals pass dorsal of the longitudinal excretory vessels and nerve. Vas deferens coiled, seminal vesicle not developed. Testicles in medullary portion of segment surrounding the female glands at the sides and behind, typically numerous (40 to 50), but may be reduced in number (7). Uterus sac-like, with few or numerous outpocketings. Adults in birds and mammals.

Type-species.—Tania angulata Rudolphi, 1810 (=Tania undula Schrank, 1788, according to Cohn, 1901b, pp. 288-293).

## DILEPIS ATTENUATA (Dujardin, 1845) Fuhrmann, 1908.

For description see Dujardin, 1845a, p. 566, pl. 9, fig. S (Txnia attenuata).—Linstow, 1875a, pp. 184–185, pl. 2, figs. 7, 8 (Txnia attenuata).

Hosts.—Anthus pratensis, Passer domesticus, Passer montanus.

### DILEPIS CAPRIMULGORUM Fuhrmann, 1908.

For description see Fuhrmann, 1908b, pp. 49-50, fig. 35.

Host.—Chordeiles virginianus.

## (? DILEPIS) CYLINDRICA Clerc, 1903.

For description see Clerc, 1903, pp. 337-339, pl. 10, figs. 48, 50, 52, 60.

Host.—Larus canus.

### DILEPIS LIMOSA Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 516-517, fig. 1.

Hosts.—Numenius phæopus, Limosa limosa.

### DILEPIS NYMPHOIDES Clerc, 1903.

For description see Clerc, 1903, pp. 340-341, pl. 10, fig. 70.

Host.—Pisobia damacensis.

DILEPIS PAPILLIFERA Fuhrmann, 1908.

For description see Fuhrmann, 1908b, pp. 48-49, figs. 33, 34.

Host - Florida carulea

DILEPIS RETIROSTRIS (Krabbe, 1869) Zschokke, 1903.

For description see KRABBE, 1869b, pp. 282-283, pl. 5, figs. 97-99 (Tania retirostris).

Hosts.—Arenaria interpres, Pelidna alpina.

DILEPIS SCOLECINA (Rudolphi, 1810) Fuhrmann, 1908.

For description see KRABBE, 1869b, pp. 280-281, pl. 4, figs. 88-90 (Tania scolecina).

Host.—Phalacrocorax carbo.

\* DILEPIS TRANSFUGA & (Krabbe, 1860) Fuhrmann, 1008.

For description see Krabbe, 1869b, p. 281, pl. 4, figs. 91-93 (Tania transfuga).

Host.—\*Ajaia ajaja.

DILEPIS UNDULA (Schrank, 1788) Cohn, 1900.

For description see Volz, 1900, pp. 130-135, pl. 6, figs. 5, 6; pl. 7, fig. 7 (Dilepis undulata).

Hosts.—Sturnus vulgaris, Turdus musicus, Pica pica, Corvus corax.

DILEPIS UNILATERALIS b (Rudolphi, 1819) Clerc, 1906.

For description see Krabbe, 1869b, pp. 276-278, pl. 4, figs. 79-83 (Tænia unilateralis).—Clerc, 1906b, pp. 714-715, figs. 3, 4.

Hosts.—Butorides virescens, Casmerodius egretta, Ardea cinerea.

DILEPIS URCEUS (Wedl, 1856) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 279-280, pl. 4, figs. 85-87 (Tania urceus).

Host.—Plegadis autumnalis.

a This species has been collected a number of times from birds (*Ajaia ajaja*) dying at the National Zoological Park, Washington, D. C. (Bureau of Animal Industry, Helminthological Collection, Nos. 4162, 4163, 4165, 4452.)

b This species was first described by Rudolphi (1819a, pp. 696-697). Under the caption A. Ardex virescentis, he refers to a large specimen about 7 inches long and several small specimens. The description which Rudolphi gives of these specimens indicates that the material comprised more than one species. Krabbe (1869b) redescribed and figured Txnia unilateralis on the basis of the small specimens in Rudolphi's original material. Fuhrmann (1906b, p. 740), who reexamined Rudolphi's material, states that the species T. unilateralis belongs in Hymenolepis and is identical with H. ardex Fuhrmann (1906b, pp. 451-452, figs. 37-39), the latter name falling as a synonym of H. unilateralis.

It should be noted, however, that Hymenolepis ardex, as described by Fuhrmann (1906b, p. 451), is a species of considerable size, which indicates that Fuhrmann in examining Rudolphi's material did not find the small specimens which Krabbe described as T. unilateralis. As the specimens from Rudolphi's collection, which Krabbe described and figured, are quite different from Hymenolepis ardex, it is evident that the type material of Txnia unilateralis originally represented more than one species, Krabbe having studied one form and Fuhrmann another. As Krabbe's description antedates Fuhrmann's, the species which the former author selected as Txnia unilateralis should retain that name, rather than the form which Fuhrmann selected. Dilepis campylancristrota (Wedl, 1856), which Fuhrmann (1908a, p. 52) accepts as the appropriate name for the form described by Krabbe, falls into synonymy.

# Genus TRICHOCEPHALOIDES Sinitsin, 1896.

Generic diagnosis.—Dipylidiinæ: Rostellum with single crown of hooks. Genital pores unilateral, subdorsal. Testicles few, but more than four, in posterior region of segment. Uterus sac-like; eggs few. Adults in birds.

Type-species.—Trichocephaloides inermis Sinitsin, 1896 (= Tænia megalocephala Krabbe, 1869; see Fuhrmann, 1901a, p. 761, and Clerc. 1902a. p. 662).

## TRICHOCEPHALOIDES MEGALOCEPHALA (Krabbe, 1869) Clerc, 1902.

For description see Krabbe, 1869b, pp. 283-284, pl. 5, figs. 100-103 (*Tænia megalocephala*).—Clerc, 1902a, pp. 662-663, fig. 5; 1903, pp. 350-353, pl. 9, fig. 33; pl. 10, fig. 57.

Hosts.—Totanus totanus, Calidris leucophæa, Pisobia damacensis, Erolia ferruginea, Pelidna alpina, Arquatella maritima.

### Genus LATERIPORUS Fuhrmann, 1907.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a single crown of 12 to 16 hooks (120 to  $170\mu$  long), with long dorsal and short ventral root, and well-developed blade. Genital pores unilateral. Genital canals pass dorsal of the longitudinal excretory vessels. Testicles 12 to 30 in number, behind, or at the sides of, the female glands. Uterus sac-like, filling the entire medullary parenchyma in gravid segments. Adults in birds.

Type-species.a—Lateriporus teres (Krabbe, 1869) Fuhrmann, 1907.

### LATERIPORUS BIUTERINUS Fuhrmann, 1008.

For description see Fuhrmann, 1908b, pp. 56-58, figs. 44-46.

Hosts.—Oidemia fusca, Cairina moschata, Dendrocuana autumnalis.

### LATERIPORUS TERES (Krabbe, 1869) Fuhrmann, 1907.

For description see Krabbe, 1869b, pp. 284-285, pl. 5, figs. 106-108 (*Tænia teres*).— Fuhrmann, 1907b, pp 521-523, figs. 13-15.

Hosts.—Somateria mollissima, Harelda huemalis.

<sup>&</sup>lt;sup>a</sup> Fuhrmann in his original publication on this genus (1907b, p. 521) did not select a type-species. He refers only to two species *Lateriporus teres* (Krabbe) and *Lateriporus propeteres* Fuhrmann, hence one of these under the International Code of Nomenclature must be the type. Fuhrmann (1908b, p. 54; 1908a, p. 53) has selected *L. spinosus* Fuhrmann, 1908, as type, a selection which evidently can not stand, since this species is not one of the original species of the genus.

### Genus CHOANOTÆNIA a Railliet, 1896.

Monopylidium Fuhrmann, 1899 (type, Davainea musculosa Fuhrmann, 1896: in part).

Icterotænia RAILLIET and HENRY, 1909 (in part).

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a single crown of hooks usually with long dorsal and short ventral root. Segments numerous, rarely less than 30. Genital pores irregularly alternate near the anterior border of the segment. Genital canals pass between the longitudinal excretory vessels and dorsal of the nerve. Vas deferens coiled, seminal vesicle absent. Testicles numerous, in the posterior region of the segment, or, also, laterally on each side of the female glands. Uterus persistent, sac-like, but may be subdivided into numerous small communicating chambers incompletely separated by partitions infolded from the wall of the uterus, so that in some cases the eggs appear almost as if isolated in the parenchyma. Adults in birds and mammals.

aAlthough Fuhrmann (1908a, 1907a) and Clerc (1903) recognize Monopylidium and Choanotxnia as distinct genera, they would place Ch. infundibuliformis, the type of Choanotxnia in Monopylidium, and Fuhrmann (1908a) has selected Choanotxnia galbulæ (Zeder, 1803) as a new type for Choanotænia. This arrangement, as has been pointed out by Railliet and Henry (1909, p. 338), is in violation of the law of priority of the International Code of Zoological Nomenclature, inasmuch as a type once fixed Monopulidium must fall into synonymy if Ch. infundibuliformis can not be changed. (type of Choanotxnia) is made congeneric with Monopylidium musculosum (type of Monopylidium), Choanotxnia (1893) being of date prior to that of Monopylidium (1899). If, as Clerc and Fuhrmann believe, Ch. infundibuliformis and M. musculosum should go into the same genus, that genus must be known as Choanotania, not as Monopylidium. Such action would leave the genus Choanotænia of Fuhrmann (not Railliet) without a name, and it would become necessary to rename the genus. This Railliet and Henry (1909, p. 338) have done, proposing the name Icterotænia for the species "Icterotxnia galbulx, porosa, parina, etc." Until, however, a more careful comparative study of the various species of Monopylidium and Choanotania, especially the type species of the two genera, has been made I believe it justifiable to recognize both these generic names, notwithstanding this necessitates the separation of Choanotænia infundibuliformis and Monopylidium musculosum, which Clerc and Fuhrmann - would place together. I am inclined to doubt that the uterus of the former species breaks down into egg capsules as Clerc (1903) has stated. My own observations support those of Cohn (1901b), who affirms that the uterus is persistent, and possesses an irregularly lobulated cavity incompletely subdivided by infoldings from the wall. If this is true, and if no later development of egg capsules occurs, Choanotania infundibuliformis differs from Monopylidium, in which the uterus is said to break down into egg capsules, and it is therefore possible to recognize both Choanotania and Monopylidium changing but slightly Fuhrmann's arrangement of species, namely removing Choanotxnia infundibuliformis from Monopylidium to Choanotxnia, where it belongs. I have not considered the differences between Monopylidium and such genera as Choanotxnia, and Anomotxnia, sufficiently marked to warrant placing them in different subfamilies, as Fuhrmann (1907a, 1908a) has done. Monopylidium, in spite of the breaking down of the uterus, seems to me much more closely related to the genera named than to Dipylidium, with which Fuhrmann has united it in a subfamily separate from the others.

Type-species.—Choanotænia infundibuliformis<sup>a</sup> (Goeze, 1782) Railliet, 1896 = Tænia infundibulum Bloch, 1779.

### CHOANOTÆNIA BILATERALIS Fuhrmann, 1908.

For description see Fuhrmann, 1908a, pp. 32-33, figs. 9, 10.

Host.—Colymbus dominicus.

# CHOANOTÆNIA BOREALIS (Linstow, 1905) Fuhrmann, 1908.

For description see Linstow, 1905dd, pp. 11-12, pl. 2, fig. 41; pl. 3, figs. 42, 43 (*Aporina borealis*).—Fuhrmann, 1908a, p. 55.

Host.—Harelda hyemalis.

## CHOANOTÆNIA CORONATA (Creplin, 1829) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 275-276, pl. 3, figs. 74-76 (Tania coronata).

Host.—Ægialitis nivosa.

## CHOANOTÆNIA DODECACANTHA (Krabbe, 1869) Fuhrmann, 1908.

For description see KRABBE, 1869b, p. 261, pl. 1, figs. 14, 15 (Tania dodecacantha).

Host.—Larus minutus.

## CHOANOTÆNIA EMBRYO (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 273-274, pl. 3, figs. 65, 66 (Tænia embryo).

Hosts.—Gallinago gallinago, Scolopax rusticola.

## \* CHOANOTÆNIA INFUNDIBULUM (Bloch, 1779) Cohn, 1899.

For description see Cohn, 1901b, pp. 365-368, pl. 31, fig. 46; pl. 32, fig. 47.— CLERC, 1903, pp. 354-356, pl. 11, figs. 72, 74-76, 83 (Monopylidium infundibuliformis).—Ransom, 1905b, pp. 276-277, figs. 4, 11, 15, 23, 29 (Choanotænia infundibuliformis).

Hosts.—\*Gallus gallus domesticus, Phasianus colchicus, Coturnix coturnix.

### CHOANOTÆNIA INVERSA (Rudolphi, 1819) Fuhrmann, 1908.

For description see Rudolphi, 1819a, pp. 156, 510-511 (*Tænia inversa*).—Villot 1875, p. 475, pl. 12, fig. 8 (*Tænia inversa*).

Host.—Sterna paradisæa.

#### CHOANOTÆNIA LÆVIGATA (Rudolphi, 1819) Clerc, 1906.

For description see Krabbe, 1869b, p. 275, pl. 3, figs. 71-73 (*Tænia lævigata*).—Clerc, 1906b, pp. 719-720, figs. 16, 17.

Hosts.—Charadrius apricarius, Ægialitis hiaticula, Ægialitis nivosa.

### CHOANOTÆNIA PARADOXA (Rudolphi, 1802) Clerc, 1903.

For description see Krabbe, 1869b, pp. 274-275, pl. 3, figs. 69, 70 (*Tænia paradoxa*).—Clerc, 1903, pp. 327-332, pl. 10, figs. 53, 55, 61, 62.

Hosts.—Hæmatopus ostralegus, Charadrius apricarius, Erolia ferruginea, Gallinago gallinago, Scolopax rusticola, Lobipes lobatus.

#### CHOANOTÆNIA PARINA (Dujardin, 1845) Clerc, 1906.

For description see DUJARDIN, 1845a, p. 598, pl. 9, fig. E (*Tænia parina*).— Krabbe, 1869b, pp. 341-342, pl. 10, figs. 291, 292 (*Tænia parina*).—Clerc, 1906b, p. 719, fig. 15.

Hosts.—Passer domesticus, Passer montanus, ? Sturnus vulgaris.

<sup>&</sup>lt;sup>a</sup>According to the law of priority the correct name of this species is *Choanotænia infundibulum* (Bloch, 1779).

CHOANOTÆNIA POROSA (Rudolphi, 1810) Cohn, 1899.

For description see Krabbe, 1869b, pp. 260-261, pl. 1, figs. 10-13 (*Tania porosa*).—Cohn, 1901b, pp. 368-372, pl. 32, figs. 48-50.—Clerc, 1903, p. 320, pl. 11, fig. 86.

Hosts.—Rissa tridactyla, Larus marinus, Larus argentatus, Larus californicus, Larus canus, Larus minutus, Sterna hirundo.

## CHOANOTÆNIA STELLIFERA (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 274, pl. 3, figs. 67, 68 (Tænia stellifera); 1882a, p. 352, pl. 1, fig. 8 (T. stellifera).

Host.—Scolopax rusticola.

## CHOANOTÆNIA STERNINA (Krabbe, 1869) Clerc, 1903.

For description see Krabbe, 1869b, pp. 259-260, pl. 1, figs. 7-9 (*Tænia sternina*).—Clerc, 1903, pp. 320-321.

Hosts.—Larus canus. Sterna hirundo. Sterna paradisza.

### Genus MONOPYLIDIUMa Fuhrmann, 1899.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a double or single crown of hooks. A single set of reproductive organs in each segment. Genital pores irregularly alternate, rarely unilateral. Genital canals pass between the longitudinal excretory vessels and dorsal of the longitudinal nerve or dorsal of both excretory vessels. Testicles numerous (20 to 40 or more), behind the female glands or, also, laterally on both sides of the latter. Vas deferens coiled; seminal vesicle absent. Uterus breaks down into egg capsules, each containing one or several eggs. Adults in birds.

Type-species.—Monopylidium musculosum (Fuhrmann, 1896) Fuhrmann, 1899.

#### MONOPYLIDIUM CINGULIFERUM (Krabbe, 1869) Clerc, 1902.

For description see KRABBE, 1869b, p. 272, pl. 3, figs. 59, 60 (*Tænia cingulifera*).—CLERC, 1903, pp. 356-359, pl. 9, fig. 43; pl. 10, figs. 49, 51.

Hosts.—Ægialitis dubia, Totanus totanus, Machetes pugnax, Pisobia damacensis.

#### MONOPYLIDIUM MACRACANTHUM Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 530-531, fig. 33.

Host.—Helodromas ochropus.

## MONOPYLIDIUM MUSCULOSUM (Fuhrmann, 1896) Fuhrmann, 1899.

For description see Fuhrmann, 1896n, pp. 122-127, pl. 4, figs. 6-9 ([f.Davainea] musculosa); 1899f, pp. 622-627.

Host.—Sturnus vulgaris.

## MONOPYLIDIUM PASSERINUM Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 528-529, figs. 28, 29.

Host.—Passer domesticus.

## MONOPYLIDIUM ROSTELLATUM Fuhrmann, 1908.

For description see Fuhrmann, 1908b, pp. 63-65, fig. 52

Host.—Himantopus mexicanus.

### Genus ANOMOTÆNIA Cohn, 1900.

Choanotænia "Cohn" of Clerc, 1903.

Diplochetos Linstow, 1906 (type, D. volvulus Linstow, 1906).

Generic diagnosis.—Dipylidiinæ: Rostellum with double crown of hooks, with long dorsal and short ventral root, and long blade. Genital pores irregularly alternate near anterior border of segment. Genital canals pass between the longitudinal excretory vessels and dorsal of the nerve. Vas deferens coiled, seminal vesicle absent. Testicles numerous, in posterior portion of segment, or, also, laterally on both sides of the female glands. Uterus sac-like. Adults in birds and mammals.

Type-species.—Anomotænia microrhyncha (Krabbe, 1869) Cohn, 1900.

### ANOMOTÆNIA ACOLLUM Fuhrmann, 1907.

For description see Fuhrmann 1907b, pp. 517-518, fig. 2.

Host.—Crotophaga ani.

### ANOMOTÆNIA ÆGYPTIACA (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe 1869b, pp. 272-273, pl. 3, fig. 61, 62 (Twnia wgyptiaca).—Clerc, 1903, pp. 333-334 (Choanotwnia wgyptiaca).

Hosts.—Scolopax rusticola, Gallinago gallinago.

### ANOMOTÆNIA ARIONIS (Siebold, 1850) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 268-269, pl. 2, fig. 47 (Txnia arionis).—CLERC, 1903, p. 333 (Choanotxnia arionis).

Hosts.—Totanus melanoleucus, Totanus flavipes, Helodromas ochropus.

## ANOMOTÆNIA AURITA (Rudolphi, 1819) Fuhrmann, 1908.

For description see Rudolphi, 1819a, pp. 697, 698-699 (Tania aurita).

Host.—Florida cærulea.

# ANOMOTÆNIA BACILLIGERA (Krabbe, 1869) Fuhrmann, 1908.

For description see KRABBE, 1869b, p. 273, pl. 3, figs. 63, 64 (Tania bacilligera).

Hosts.—Gallinago gallinago, Scolopax rusticola.

### ANOMOTÆNIA BOREALIS (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 338, pl. 10, figs. 282, 283 (*Tænia borealis*).— Clerc. 1906b, pp. 718-719, figs. 12-14 (*Choanotænia borealis*).

Hosts.—Motacilla alba, Plectrophenax nivalis.

### ANOMOTÆNIA CAMPYLACANTHA (Krabbe, 1869) Zschokke, 1903.

For description see Krabbe, 1869b, p. 263, pl. 1, figs. 22-24 (Tænia campy-lacantha).

Host.—Cepphus grylle.

### ANOMOTÆNIA CINGULATA a (Linstow, 1905) Fuhrmann, 1908.

For description see Linstow, 1905dd, p. 9, pl. 2, figs. 32-34 (Dilepis cingulata).

Host.—Pelidna alpina.

<sup>&</sup>lt;sup>a</sup>This species is perhaps the same as *Anomotænia clavigera*. (See Fuhrmann, 1908a, p. 57)

#### ANOMOTÆNIA CITRUS (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 270, pl. 2, figs. 48-50 (Twnia citrus).—Clerc, 1903, p. 321 (Choanotwnia citrus).

Host.—Gallinago gallinago.

#### ANOMOTÆNIA CLAVIGERA (Krabbe, 1869) Cohn. 1900.

For description see Krabbe, 1869b, p. 267, pl. 2, figs. 41-43 (*Tænia clavigera*).— Сонл, 1901b, p. 405.

Hosts.—Arenaria interpres, Pisobia damacensis, Pelidna alpina, Tringa canutus.

### \*ANOMOTÆNIA CONSTRICTA (Molin, 1858).

For description see Krabbe, 1869b, p. 329, pl. 9, figs. 252-256 (*Tænia constricta*).—Volz, 1900, pp. 117-126, pl. 6, figs. 1-3 (*T. constricta*).—Cohn, 1901b, pp. 405-407 (*Anomotænia puncta*).—Clerc, 1903, pp. 334-335 (*Choanotænia constricta*).

Hosts.—Turdus musicus, \*Pica pica, a \*Corvus ossifragus, b \*Corvus brachyrhynchos, c Corvus corax.

#### ANOMOTÆNIA CYATHIFORMIS (Frölich, 1791) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 330-331, pl. 9, fig. 260 (Tenia cyathiformis)

Host.—Riparia riparia.

## ANOMOTÆNIA ERICETORUM (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 270-271, pl. 3, figs. 51, 52 (Twnia ericetorum).

Host,—Charadrius apricarius.

#### ANOMOTÆNIA GLOBULUS (Wedl, 1856) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 271, pl. 3, figs. 53-55 (Txnia globulus).—Clerc, 1903, pp. 323-325 (Choanotxnia globulus).

Hosts.—Helodromas ochropus, Machetes pugnax.

#### ANOMOTÆNIA HIRUNDINA Fuhrmann, 1907.

For description see Fuhrmann, 1907b, p. 518, figs. 5, 6.

Host.—Riparia riparia.

### ANOMOTÆNIA LARINA (Krabbe, 1869) Zschokke, 1903.

For description see KRABBE, 1869b, pp. 261-262, pl. 1, figs. 16, 17 (Tania larina).

Hosts.—Rissa tridactyla, Larus hyperboreus.

### ANOMOTÆNIA MICRACANTHA (Krabbe, 1869) Zschokke, 1903.

For description see Krabbe, 1869b, pp. 262-263, pl. 1, figs. 18-21 (Tenia micracantha).

Hosts.—Pagophila alba, Rissa tridactyla, Larus hyperboreus, Larus marinus, Larus canus, Cepphus grylle.

a Bureau of Animal Industry Helminthological Collection, No. 3656 from Pica pica hudsonia, Montana.

b Bureau of Animal Industry Helminthological Collection, No. 2752.

c U. S. National Museum Helminthological Collection, Nos. 5956, 5988, 6003.

#### ANOMOTÆNIA MICROPHALLOS (Krabbe, 1860) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 266, pl. 2, figs. 35-37 (Twinia microphallos).—Clerc, 1903, pp. 336-337 (Choanotwnia microphallos).

Hosts.—Vanellus vanellus. Pisobia damacensis.

#### ANOMOTÆNIA MICRORHYNCHA (Krabbe, 1869) Cohn, 1900.

For description see Krabbe, 1869b, p. 266, pl. 2, figs. 38-40 (*Tænia microrhyncha*).—Cohn. 1901b, pp. 403-405.

Hosts.—Charadrius apricarius, Ægialitis hiaticula, Ægialitis dubia. Machetes pugnax.

#### ANOMOTÆNIA MUTABILIS (Rudolphi, 1819) Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 517-518, figs. 3, 4.

Host.—Crotophaga ani.

## ANOMOTÆNIA NYMPHÆA (Schrank, 1790) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 264-266, pl. 2, figs. 30-34 (Tænia numphæa).

Hosts.—Numenius borealis, Numenius phæopus, Bartramia longicauda.

### ANOMOTÆNIA PLATYRHYNCHA (Krabbe, 1869) Cohn, 1900.

For description see Krabbe, 1869b, pp. 271-272, pl. 3, figs. 56-58 (Twnia platy-rhyncha).—Cohn, 1901b, pp. 400-403, pl. 34, fig. 80.

Hosts.—Totanus totanus, Pisobia damacensis.

#### ANOMOTÆNIA PYRIFORMIS (Wedl, 1856) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 264, pl. 2, figs. 28, 29 (Tania pyriformis).

Host.—Crex crex.

## ANOMOTÆNIA SLESVICENSIS (Krabbe, 1882) Fuhrmann, 1908.

For description see Krabbe, 1882a, p. 352, pl. 1, fig. 9 (Tania slesvicensis).

Hosts.—Gallinago gallinago, Scolopax rusticola.

#### ANOMOTÆNIA SOCIABILIS, new name.

For description see Krabbe, 1869b, p. 258, pl. 1, figs. 1-3 (Tænia socialis).

Host - Uria troile

## ANOMOTÆNIA TORDÆ (Fabricius, 1780) Fuhrmann, 1908.

For description see KRABBE, 1869b, p. 259, pl. 1, figs. 4-6 (Tania armillaris).

Hosts.—Uria troile, Alca torda.

## ANOMOTÆNIA TRIGONOCEPHALA (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 339, pl. 10, figs. 284-286 (Twnia trigono cephala).

Host.—Saxicola ananthe.

<sup>&</sup>lt;sup>a</sup> New name for A. socialis (Krabbe, 1869) Fuhrmann, 1908. Tænia socialis Krabbe; 1869 is a homonym of Tænia socialis Retzius, 1786.

#### ANOMOTÆNIA VARIABILIS \* (Rudolphi, 1802).

For description see Krabbe, 1869b, pp. 267-268, pl. 2, figs. 44-46 (Tania variabilis).—Clerc, 1903, pp. 321-323 (Choanotania variabilis).

Hosts.—Vanellus vanellus, Squatarola squatarola, Totanus totanus, Erolia ferruginea, Pelidna alpina, Gallinago gallinago, Philohela minor

### Genus AMŒBOTÆNIA Cohn, 1899.

Generic diagnosis.—Dipylidiinæ: Rostellum with a single crown of hooks. Neck absent. Segments few (not over 30), much broader than long. Genital pores regularly alternate. Testicles rather numerous (12 or more), in posterior portion of segment. Uterus saclike, fills entire medullary portion of gravid segment. Adults in birds

Type-species.—Amæbotænia sphenoides (Railliet, 1892) Cohn, 1899.

AMŒBOTÆNIA BREVIS (Linstow, 1884) Fuhrmann, 1908.

For description see Linstow, 1884a, p. 143, figs. 33, 34 (Tania brevis).

Hosts.—Squatarola squatarola, Charadrius apricarius, Ægialitis hiaticula.

#### \*AMŒBOTÆNIA SPHENOIDES b (Railliet, 1892) Cohn, 1899.

For description see Cohn 1901b, pp. 381-385, pl. 33, figs. 57-59 (Amabotania cunenta).

Host.—\* Gallus gallus domesticus.

### Genus LIGA Weinland, 1887.

Fuhrmannia Parona, 1901 (type, F. brasiliensis Parona).

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a double crown of hooks with long dorsal and short ventral root. Strobila with 12 to 16 segments. Genital pores regularly alternate; located

This species has been fully described by Cohn (1901b) under the erroneous name Amæbotænia cuneata. Tænia cuneata Linstow, 1872, is a homonym of Tænia cuneata Batsch, 1786; hence, under the International Code of Zoological Nomenclature, the name cuneata can not be used for the species described by Linstow in any generic combination whatsoever.

Amæbotænia sphenoides has been found in this country in Maryland and the District of Columbia (Bureau of Animal Industry Helminthological Collection Nos. 14521, 14713, 14746).

a Frölich (1802a, pp. 86-87, pl. 2, figs. 23-25) described a species under the name of *Tænia stentorea* from *Tringa hypoleucos*, which Rudolphi (1819a, p. 498) considers identical with *Tænia variabilis*. The name *stentorea* should replace *variabilis* if it can be proved that Frölich's paper appeared prior to Rudolphi's paper of 1802, otherwise the species should continue to be known as *variabilis*.

b Synonomy — Tænia cuneata Linstow, 1872, not Batsch, 1786; Tænia sphenoides Railliet, 1892; Dicranotænia cuneata (Linstow, 1872) Railliet, 1893; Dicranotænia sphenoides (Railliet, 1892) Railliet, 1896; Amæbotænia sphenoides (Railliet, 1892) Cohn, 1899; Amæbotænia cuneata (Linstow, 1872) Cohn, 1901.

in the anterior third of the segment. Genital canals pass dorsal of excretory vessels and nerve. Testicles about 18 in number, located posterior of the female glands. Vas deferens much coiled, in the anterior portion of the segment, without vesicular enlargement. Ovary a simple sac, median, in anterior half of segment. Yolk gland a simple sac posterior of ovary. Uterus thin-walled, much lobulated, occupying most of the medullary portion of the gravid segment. Outer shell of the egg with a tubular prolongation at each pole terminating in a globular expansion. Adults in birds.

Type-species.—Liga punctata a (Weinland, 1856) Weinland, 1857— Liga brasiliensis (Parona, 1901) Ransom, 1909.

### \*LIGA BRASILIENSIS (Parona, 1901) Ransom, 1909.

For description see Fuhrmann, 1907b, p. 521, fig. 12 (Fuhrmannia brasiliensis).— Ransom, 1909, pp. 22-25, figs. 9-14 (the present paper).

Host.—\* Colaptes auratus.

## Genus LEPTGTÆNIA Cohn, 1901.

Generic diagnosis.—Dipylidiinæ: Scolex relatively very large. Rostellum armed with a single crown of hooks with long dorsal root and short ventral root, and rather short blade. Neck absent. Segments few (12 to 15). Genital pores regularly alternate. Reproductive organs protogynous in development. Testicles rather numerous (12 to 15), lateral in position toward the pore side of segment. Cirrus pouch and cirrus very long. Uterus sac-like, fills entire gravid segment. Adults in birds.

Type-species.—Leptotænia ischnorhyncha (Lühe, 1898) Cohn, 1901.

### Genus PARVIROSTRUM b Fuhrmann, 1907.

Generic diagnosis.—Dipylidiinæ: Strobila small, division into segments not well marked. Scolex large, rostellum small, armed with double crown of hooks. Genital pores irregularly alternate. Reproductive glands very small. Testicles in lateral portions of segment. Ovary and yolk gland toward pore side of segment. Uterus sac-like. Adults in birds.

Type-species.—Parvirostrum reticulatum Fuhrmann, 1908.

### Genus CYCLUSTERA Fuhrmann, 1901.

Generic diagnosis.—Dipylidiinæ: Rostellum with double crown of hooks. Longitudinal musculature in three layers. Genital pores regu-

<sup>&</sup>lt;sup>a</sup> As Liga punctata is invalid (see p. 21), and Liga brasiliensis is the next available name, the latter is the correct designation of this species.

b This genus was first mentioned without description or designation of type by Fuhrmann in 1907 (1907a, p. 292), and was first described in 1908 (1908b, p. 60), *P. reticulatum* being the only species.

larly alternate. Genital canals pass between the longitudinal excretory vessels and open into a very muscular cloacal canal. Testicles numerous, scattered throughout the entire dorsal medullary portion of the segment. Ovary and yolk gland surrounded by a ring-like uterus with secondary branches. Eggs with two shells. Adults in birds.

Type-species.—Txnia capito Rudolphi, 1819.

\* CYCLUSTERA CAPITO a (Rudolphi, 1819) Fuhrmann, 1901.

For description see Krabbe, 1869b, pp. 281-282, pl. 4, figs. 94, 95 (Tania capito).

Host.—\*Ajaia ajaja.

## Genus LATEROTÆNIA Fuhrmann, 1906.

Generic diagnosis.—Dipylidiinæ: Rostellum simple, armed with a double crown of hooks. Genital pores irregularly alternate. Genital canals pass dorsal of the ventral excretory vessel, and ventral of the dorsal excretory vessel and longitudinal nerve. Testicles numerous, in lateral portions of segment in the region of the longitudinal excretory vessels. Female glands toward the pore side of the segment in the lateral portion of the medullary parenchyma. Uterus sac-like. Eggs with two envelopes. Adults in birds.

Type-species.—Laterotænia natteri Fuhrmann, 1906 = Laterotænia nattereri Fuhrmann, 1908 (orthographic emendation).

### Genus PROORCHIDA b Fuhrmann, 1907.

Generic diagnosis.—Dipylidiinæ: Scolex armed with a double crown of hooks. Genital pores unilateral. Testicles in front of the female glands. Uterus much lobulated (?). Adults in birds.

Type-species.—Proorchida lobata Fuhrmann, 1908.

## Genus CYCLORCHIDA Fuhrmann, 1907.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a double crown of hooks, which have a very large dorsal root and small hook portion. Genital pores unilateral. Genital canals pass between the longitudinal excretory vessels. Cirrus pouch communicating with the genital cloaca by a narrow canal opening upon a large

a This species, originally described by Rudolphi on the basis of specimens collected in Brazil, has been found in the same host, Ajaia ajaja (Bureau of Animal Industry, Helminthological Collection No. 4164), in this country, at the National Zoological Park, Washington, D. C., where the bird had been brought from Texas. Fuhrmann (1908a, p. 138), probably through error, lists C. capito in Platalea leucerodia, but not in Ajaia ajaja.

<sup>&</sup>lt;sup>b</sup> This genus was first mentioned by Fuhrmann in 1907 (1907a, p. 292), but was not described nor was the type designated until 1908 (1908b, p. 59).

papilla. Testicles very numerous, entirely surrounding the female genital glands. Uterus ventral, growing laterally between the excretory vessels into the cortical parenchyma. Adults in birds.

Type-species.—Cyclorchida omalancristrota (Wedl, 1856) Fuhrmann. 1907.

### Genus GRYPORHYNCHUSª Nordmann, 1832.

Acanthocirrus Fuhrmann, 1907 (type, A. macrorostratus Fuhrmann, 1907).

Generic diagnosis.—Dipylidiinæ: Rostellum armed. Genital pores unilateral. Genital canals pass between the longitudinal excretory vessels. Root of cirrus with one or two pairs of powerful spines lying in special pockets. Testicles few (6 to 8). Uterus sac-like. Adults in birds.

Type-species.—Gryporhynchus pusillus Nordmann, 1832 = larva of Acanthocirrus macropeos (Wedl, 1856).

### GRYPORHYNCHUS PUSILLUS Nordmann, 1832.

For description see Krabbe, 1869b, p. 279, fig. 84 (Tania macropeos Wedl).

Host.—Nycticorax nycticorax.

## GRYPORHYNCHUS CHEILANCRISTROTUS (Wedl, 1856).

For description see Clerc, 1906b, pp. 716-718, figs. 7-11 (Dilepis macropeos).b

Host.—Ardea cinerea.

## GRYPORHYNCHUS MACROROSTRATUS (Fuhrmann, 1907).

For description see Fuhrmann, 1907b, pp. 527-528, figs. 24-27 (Acanthocirrus macrorostratus).

Host.—Anthus pratensis.

# Genus ANGULARIA Clerc, 1906.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with a zigzag crown of numerous hooks (about 50). Genital pores irregularly

<sup>b</sup>The form which Clerc describes and figures under the name *Dilepis macropeos*, according to Fuhrmann (1908a, p. 63), is in reality the species *Tænia cheilancristrota* Wedl, 1856.

a Acanthocirrus, described by Fuhrmann (1907b) for the two species A. macrorostratus (designated as type by Fuhrmann, 1908a, p. 63) and Dilepis macropeos (Wedl) of Clerc, 1906 falls into synonymy. Fuhrmann (1908a, p. 63) lists the following species in Acanthocirrus: A. macrorostratus, A. cheilancristrota (Wedl, 1856)=Dilepis macropeos (Wedl) of Clerc, and A. macropeos (Wedl, 1856). Krabbe (1869b, p. 279) who examined Wedl's original specimens of Txnia macropeos, states that in the shape and size of the hooks they correspond so exactly to Gryporhynchus pusillus that the latter must be considered the larval form of Txnia macropeos. Now as Gryporhynchus pusillus described in 1832 by Nordmann is the only original and hence type-species of Gryporhynchus, this generic name takes precedence over any later genus in which its type may be placed. Accordingly the placing of Txnia macropeos Wedl=Gryporhynchus pusillus in Acanthocirrus necessitates the dropping of the name Acanthocirrus.

alternate. Genital canals pass dorsal of the longitudinal excretory vessels. Vas deferens coiled, seminal vesicle absent. Testicles 20 to 25 in the posterior portion of the segment. Uterus with very irregular lobulations. Adults in birds.

Type-species.—Angularia beema Clerc, 1906.

ANGULARIA BEEMA Clerc, 1906.

For description see Clerc. 1906b, pp. 728-730, figs. 27-31.

Host.—Riparia riparia.

Genus CATENOTÆNIAª Janicki, 1904.

Cladotænia Cohn, 1901 (in part).

Generic diagnosis.—Dipylidiinæ: Scolex unarmed, without rostellum. Segments considerably longer than broad. A single set of reproductive organs in each segment. Genital pores irregularly alternate. Genital canals pass dorsal of longitudinal excretory vessels and nerve. Testicles numerous, in posterior portion of segment. Female glands in anterior portion. Uterus consists of a median stem and lateral branches. Adults in mammals.

Type-species.—Catenotænia pusilla (Goeze, 1782) Janicki, 1904.

## Genus DIPYLIDIUM Leuckart, 1863.

Generic diagnosis.—Dipylidiinæ: Rostellum armed with several rings of rose-thorn hooklets, which usually have a discoidal base. Suckers unarmed. Gravid segments generally longer than broad. A double set of reproductive organs in each segment. Genital pores double and opposite. Testicles very numerous, scattered throughout entire medullary parenchyma. Vas deferens coiled, seminal vesicle absent. Uterus at first reticular, later breaking up into egg capsules, each containing one or more eggs. Eggs with two shells. Adults in mammals and birds.

Type-species.—Dipylidium caninum (Linnæus, 1758).

### Genus OOCHORISTICA Lühe, 1898.

Generic diagnosis.—Dipylidiinæ: Scolex unarmed, without rostellum. A single set of reproductive organs in each segment. Genital

a Fuhrmann (1907a, p. 293) would suppress this generic name in favor of Cladotxnia Cohn, 1901, type-species, Txnia globifera Batsch, 1786, a species which (see Fuhrmann, 1906a, p. 220) is considered sufficiently similar to Txnia solium to belong in the same genus, but, under the rules of nomenclature, if Cladotxnia globifera is transferred to Txnia, the generic name Cladotxnia becomes a synonym of Txnia, and can not be used as a separate genus so long as the species globifera remains in Txnia. Cohn (1901b, p. 380) definitely designated Txnia globifera as the type of Cladotxnia, and hence no other species can be taken as the type of this genus. Accordingly, Fuhrmann's proposal to take Txnia dendritica Goeze (one of the species originally included both in Cladotxnia Cohn and Catenotxnia Janicki) as type of Cladotxnia Cohn, and to suppress Catenotxnia Janicki is entirely at variance with article 29 of the International Code of Nomenclature.

pores irregularly alternate. Testicles numerous, surround female glands posteriorly and on the sides. Vas deferens coiled, seminal vesicle absent. Uterus breaks down early and the eggs become inclosed singly in egg capsules. Adults in mammals and reptiles.

Type-species.—Oochoristica tuberculata (Rudolphi, 1819) Lühe, 1898.

## Genus PANCERINAª Fuhrmann, 1899.

Panceria Sonsino, 1895 (not Andres, 1877, sponge).

Generic diagnosis.—Dipylidiinæ: Scolex unarmed, without rostellum. A double set of reproductive organs in each segment. Testicles numerous, in the lateral fields of the segment, absent from the median field. Uteri develop in the lateral fields of the segment but disappear early, the eggs becoming isolated in the parenchyma, situated mostly in the lateral fields, few in the median field. Adults in reptiles.

Type-species.—Pancerina varanii (Stossich, 1895) = Panceria arenaria Sonsino, 1895.

#### Subfamily PARUTERININÆ (emended name).

"Paruterinæ" FUHRMANN, 1907.

Subfamily diagnosis.—Hymenolepididæ: Scolex usually armed, rarely without rostellum. A single (double in Stilesia, provisionally placed in this subfamily) set of reproductive organs in each segment. Uterus simple or double with a single para-uterine organ or multiple with several para-uterine organs, into which the eggs pass in the final stage of development of the segment. Adults in birds and amphibia (Stilesia in mammals).

Type-genus.—Paruterina Fuhrmann, 1906.

### Genus PARUTERINA Fuhrmann, 1906.

Generic diagnosis.—Paruternine: Rostellum simple, armed with a double crown of hooks. Genital pores unilateral or irregularly alternate. Testicles (20 to 30) surrounding the female glands behind and at the sides. In front of the uterus a longitudinally elongated parenchymatous organ develops into which the eggs pass after the gravid segments become separated from the strobila. Adults in birds.

Type-species.—Paruterina candelabraria (Goeze, 1782) Fuhrmann, 1906.

## PARUTERINA CANDELABRARIA (Goeze, 1782) Fuhrmann, 1906.

For description see Krabbe 1869b, p. 333, pl. 10, fig. 265 (Txnia candelabraria).—WOLFFHÜGEL, 1900a, pp. 153-164, figs. 85, 87-96 (Txnia candelabraria).

Host.—Asio flammeus.

<sup>&</sup>lt;sup>a</sup>Fuhrmann (1899f, p. 627; 1901a, p. 758) refers to this genus by this name, which may well be adopted in view of the fact that *Panceria* Sonsino, 1895, is a homonym of at least one earlier genus.

### Genus CULCITELLA Fuhrmann, 1906.

Generic diagnosis.—Paruterininæ: Scolex with simple rostellum, armed with a double crown of hooks. Genital pores unilateral or irregularly alternating. Genital canals pass between the longitudinal excretory vessels. Testicles numerous, in a group behind the female glands, in some cases also extending forward along the sides of the latter. A transversely elongated parenchymatous mass or parauterine organ into which, probably, the eggs finally pass, develops in front of the sac-like transversely elongated uterus. On the pore side of the segment the large usually ventral longitudinal excretory vessel is dorsal in position and the narrow usually dorsal vessel ventral, the position being normal on the other side. Adults in birds.

Type-species.—Culcitella rapacicola Fuhrmann, 1906.

## Genus RHABDOMETRA Kholodkovski, 1906.

Generic diagnosis.—Paruterininæ: Scolex unarmed, without rostellum. Genital pores irregularly alternate. Testicles (12 to 30 or more) in posterior portion of segment, in a group behind and extending forward along the sides of the female glands. Genital canals pass between the longitudinal excretory vessels. Uterus tubular and elongated longitudinally, or globular, occupying the median line of the segment. A para-uterine organ develops in front of the uterus and extends forward nearly to the anterior border of the segment. Adults in birds.

Type-species.—Rhabdometra tomica Kholodkovski, 1906.

## RHABDOMETRA NIGROPUNCTATA (Crety, 1890) Fuhrmann, 1908.

For description see Crety, 1890d, pp. 8-10, figs. 1-3 (Tania nigropunctata).—Stiles, 1896f, p. 59, pl. 20, figs. 268-270 (T. nigropunctata).

Host.—Coturnix coturnix.

#### \* RHABDOMETRA NULLICOLLIS Ransom, 1909.

For description see Ransom, 1909, pp. 25-30, figs. 15-22 (the present paper).

 $Hosts. --* Centrocercus\ urophasianus, *Pedioecetes\ phasianellus\ columbianus.$ 

#### \* RHABDOMETRA SIMILIS, Ransom, 1909.

For description see Ransom, 1909, pp. 30-34, figs. 23-26 (the present paper).

Host.—\* Coccyzus americanus.

#### Genus ANONCHOTÆNIA Cohn, 1900.

Anurina Fuhrmann, 1901. Amerina Fuhrmann, 1901.

Generic diagnosis.—Paruterininæ: Scolex unarmed, without rostellum. Genital pores irregularly (typical) or regularly alternate. Genital canals pass ventral of longitudinal excretory vessels and

nerve. Testicles few (5 to 10) or more numerous (15 or more), dorsal of female glands and toward anterior border of segment. Ovary and yolk gland, small, ovoid in shape, in middle of segment. Uterus simple, sac-like, median, or displaced toward side of segment opposite genital pore, its antero-posterior axis assuming a diagonal and sometimes a transverse position. In front of or lateral of uterus a para-uterine organ develops into which the eggs finally pass. Adults in birds.

Type-species.—Anonchotænia clava a Cohn, 1900 = Anonchotænia globata (Linstow, 1879).

## \*ANONCHOTÆNIA GLOBATA (Linstow, 1879) Fuhrmann, 1908.

For description see Cohn, 1901b, pp. 392-399, pl. 33, figs. 66-68; pl. 34, figs. 69-73 (A. clava).—Cerruti, 1901a, pp. 1-6, figs. 1-11 (Amerina alaudæ).—Fuhrmann, 1908c, pp. 623-626, figs. 1-71.—Ransom, 1909, pp. 34-36, fig. 27 (the present paper).

Hosts.—Alauda arvensis, \*Dendroica striata, \*Melospiza melodia, Passer domesticus, Passer montanus, Ægiothus linaria, Loxia curvirostra.

### ANONCHOTÆNIA LONGIOVATA (Fuhrmann, 1901) Fuhrmann, 1908.

For description see Fuhrmann, 1908c, pp. 627-629, figs. 8-11.

Host.—?Plegadis quarauna.

#### ANONCHOTÆNIA MACROCEPHALA Fuhrmann, 1908.

For description see Fuhrmann, 1908c, p. 629, fig. 13.

Host.—Progne subis.

### ANONCHOTÆNIA, species.

Mentioned by Fuhrmann, 1908a, p. 188; 1908c, p. 631.

Host.—Tyrannus melancholicus.

### Genus METROLIASTHES Ransom, 1900.

Generic diagnosis.—Paruterininæ: Scolex unarmed, without rostellum. Genital pores irregularly alternate. Genital canals pass between dorsal and ventral longitudinal excretory vessels and dorsal of the nerve. Testicles rather numerous (20 to 40), in posterior portion of segment. Uterus single in origin and consisting, when fully developed, of two spherical sacs touching in the median line and more or less fused with one another. A para-uterine organ, developing in front of the uterus, and into which the eggs pass, becomes transformed finally into a spherical egg capsule. Adults in birds.

Type-species.—Metroliasthes lucida Ransom, 1900.

<sup>&</sup>lt;sup>a</sup> Fuhrmann (1908a, p. 70; 1908c, p. 623) has shown that *Anonchotænia clava* is identical with *Tænia globata* Linstow, 1879, hence *Anonchotænia globata* is the correct name of this species.

#### \* METROLIASTHES LUCIDA Ransom, 1900.

For description see Ransom, 1900a, pp. 213-226, pl. 13, 14; 1905b, pp. 273-274, figs. 2, 9, 21, 27.

Hosts.--\* Meleagris gallopavo domestica, \* Gallus gallus domesticus? a

## Genus BIUTERINA Fuhrmann, 1902.

Generic diagnosis.—Paruterininæ: Rostellum armed with a double crown of hooks triangular in shape, i. e., with short dorsal and ventral roots. Genital pores irregularly alternate. Genital canals pass between the longitudinal excretory vessels. Uterus single in origin becomes more or less completely divided into two parts in front of which a para-uterine organ develops. The latter is transformed into an egg capsule after the passage of the eggs into it from the uteri. Eggs with two envelopes. Adults in birds.

Type-species.—Biuterina paradisea Fuhrmann, 1902 = Biuterina clavulus (Linstow, 1888).

### BIUTERINA LONGICEPS (Rudolphi, 1819) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 337-338, pl. 10, figs. 277, 278 (Tania longiceps).—Fuhrmann, 1908d, pp. 424-425, figs. 22, 23.

Host.—? Cairina moschata.

## BIUTERINA PASSERINA Fuhrmann, 1908.

For description see Clerc, 1906b, pp. 721-722, figs. 19, 20 (*Biuterina meropina*).— Fuhrmann, 1908d, pp. 426-428, figs. 28-31.

Host.—Alauda arvensis.

## BIUTERINA TRAPEZOIDES Fuhrmann, 1908.

For description see Fuhrmann, 1908d, pp. 420-421, figs. 12-14.

Host.— Molothrus ater.

### Genus NEMATOTÆNIA Lühe, 1899.

Generic diagnosis.—Paruterininæ: Scolex unarmed, without rostellum. Segmentation of strobila distinct only at the posterior end. Strobila circular in cross section. Genital pores alternate. Genital canals pass dorsal of the longitudinal excretory vessels and nerve. Uterus horseshoe-shaped, disappears early. Eggs through the action of numerous para-uterine organs become inclosed in egg capsules, 3 or 4 in each capsule. Adults in amphibia.

Type-species.—Txnia dispar Goeze, 1782.

aA specimen in the collection of the Bureau of Animal Industry is recorded as collected from a chicken, but it is very probable that a mistake in labeling has been made in this case.

b Fuhrmann (1908a, p. 68; 1908d, p. 414) has found that Biuterina paradisea is identical with Txnia clavulus Linstow, 1888. Hence, the correct name of this species is Biuterina clavulus.

### Genus STILESIA Railliet, 1893.

Generic diagnosis.—(?) Paruterininæ: Head unarmed, without rostellum. Neck present. Segments broader than long. ble set of reproductive organs in each segment, with opposite pores, or with irregularly alternating pores, those of one side, with the corresponding cirrus pouch, vagina and ovary having been suppressed. both of which conditions may occur in the same strobila. Genital canals pass between the longitudinal excretory vessels and dorsal of the nerve. Dorsal excretory vessel a considerable distance mediad from the ventral vessel. Testicles relatively few (6 to 12 in each set) in the lateral portions of the segment in the neighborhood of the longitudinal excretory vessels. Ovary small, globose, between the dorsal and ventral excretory vessel on pore side of segment. Yolk gland not apparent. Uterus small, spherical, sac-like, one in each lateral half of the segment between the dorsal and ventral excretory vessels. When the ovary is absent from one side, eggs from the opposite side of the segment appear to pass across through the median field in a manner not understood and enter the uterus of the side in which the ovary is lacking. Immediately anterior and mediad of each uterus a para-uterine organ develops into which the eggs probably pass. Eggs with two envelopes. Adults in mammals (ruminants).

Type-species.—Stilesia globipunctata (Rivolta, 1874) Railliet, 1893.

Subfamily HYMENOLEPIDINÆ (emended name).

Hymenolepinæ Perrier, 1897.

Family diagnosis.—Hymenolepididæ: Rostellum armed with a single crown of hooks, or more rarely rudimentary and unarmed. Segments always broader than long. Longitudinal muscles in two layers. A single set of reproductive organs in each segment. Genital pores unilateral. Genital canals pass on the dorsal side of the longitudinal excretory vessels and nerve. Testicles one to four. Vas deferens always short with seminal vesicle. Uterus persistent, saclike. Egg with three transparent shells. Adults in mammals and birds.

Type-genus.—Hymenolepis Weinland, 1858.

#### Genus OLIGORCHIS Fuhrmann, 1906.

Generic diagnosis.—Hymenolepidinæ: Rostellum armed with a single crown of hooks, four testicles in each segment. Seminal vesicle and seminal receptacle large. Adults in birds.

Type-species.—Oligorchis strangulatus Fuhrmann, 1906.

OLIGORCHIS STRANGULATUS Fuhrmann, 1906.

For description see Fuhrmann, 1906a, pp. 217-218, figs. 26-30.

Host.—Elanoides forficatus.

### Genus HYMENOLEPIS Weinland, 1858.

Diplacanthus Weinland, 1858 (not Agassiz 1842, fish). Lepidotrias Weinland, 1858.
Drepanidotænia Railliet, 1892.
Dicranotænia Railliet, 1892.
Echinocotyle Blanchard, 1891.
Triorchis Clerc, 1903 (1903, p. 286).

Generic diagnosis.—Hymenolepidinæ: Rostellum generally well developed and armed with a single crown of hooks, or more rarely rudimentary and unarmed. Suckers in adult rarely armed with hooklets or fine spines; are generally unarmed. Testicles three in each segment. Vas deferens with internal (i. e., inside the cirrus pouch) as well as external seminal vesicle (outside the cirrus pouch). Sacculus accessorius generally absent. Adults in mammals and birds.

Type-species.—Hymenolepis flavopunctata Weinland, 1858 = Hymenolepis diminuta (Rudolphi, 1819) Blanchard, 1891.

## Subgenus HYMENOLEPIS Weinland, 1858.

Subgeneric diagnosis.—Hymenolepis: Rostellum generally well developed and armed with a single crown of hooks, or more rarely rudimentary and unarmed. Suckers in adult generally unarmed, or, rarely, their entire surface may be covered with minute spines. Sacculus accessorius generally absent. Adults in mammals and birds.

Type-species.—Hymenolepis flavopunctata Weinland, 1858 = Hymenolepis diminuta (Rudolphi, 1819) Blanchard, 1891.

## HYMENOLEPIS ABORTIVA Linstow, 1904.

For description see Linstow, 1904m, pp. 382-383, figs. 7-10 (Txnia (Hymenolepis) voluta).a

Host.—Anas platyrhynchos.

## HYMENOLEPIS ÆQUABILIS (Rudolphi, 1810) Cohn, 1901.

For description see Krabbe, 1869b, pp. 316-317, pl. 8, figs. 212, 213 (*Txnia xquabilis*).—Stiles, 1896f, pp. 33-34, pl. 3, figs. 29, 30 (*Dicranotxnia xquabilis*).—Clerc, 1903, pp. 290-293, pl. 8, figs. 2, 16, 24 (*Drepanidotxnia xquabilis*).

Hosts.— Marila marila, Cygnus olor, Cygnus olor domesticus, Olor cygnus.

### HYMENOLEPIS AMPHITRICHA (Rudolphi, 1819) Fuhrmann, 1906.

For description see Krabbe, 1869b, pp. 311-312, pl. 8, figs. 195-197 (Txnia amphitricha).—Clerc, 1903, pp. 293-295, pl. 8, fig. 21 (Drepanidotxnia amphitricha).

Hosts.—Totanus totanus, Pelidna alpina, Arquatella maritima. Scolopax rusticola.

a Corrected to Tania (Hymenolepis) abortiva, Centralbl. f. Bak., vol. 36, p. 592.

HYMENOLEPIS ANATINA (Krabbe, 1869) Cohn, 1901.

For description see Krabbe, 1869b, pp. 287-288, pl. 6, figs. 114-116 (*Tænia anatina*).—Schmidt, 1894a, pp. 65-112, pl. 6 (*Tænia anatina*).—Stiles, 1896f, pp. 39-40, pl. 9, figs. 100-111; pl. 10, figs. 112-115 (*Drepanidotænia anatina*).—Cohn. 1901b. pp. 322-323.

Hosts.—Spatula clypeata, Dafila acuta, Chaulelasmus streperus, Anas platyrhynchos, Anas platyrhynchos domestica, Cygnus olor domesticus. Fulica atra.

## HYMENOLEPIS ARCUATA Kowalewski, 1904.

For description see Kowalewski, 1905a, pp. 3-9, pl. 7, figs. 1-9; 1905b, pp. 532-533, pl. 14, figs. 1-9.

Host.— Marila marila.

### HYMENOLEPIS ARDEÆ G Fuhrmann, 1906.

For description see Fuhrmann, 1906b, pp. 451-452, figs. 37-39.

Host.—Butorides virescens.

### HYMENOLEPIS BASCHKIRIENSIS (Clerc, 1902) Fuhrmann, 1906.

For description see Clerc, 1903, pp. 288-290 (Drepanidotænia baschkiriensis).

Host.— $Larus\ canus.$ 

#### HYMENOLEPIS BISACCATA Fuhrmann, 1006.

For description see Fuhrmann, 1906b, pp. 444-445, figs. 21-24.

Host.—Cairina moschata.

# HYMENOLEPIS BRACHYCEPHALA (Creplin, 1829).

For description see Krabbe, 1869b, pp. 294-295, pl. 6, figs. 136-140 (*Tænia brachycephala*).—Cohn, 1901b, pp. 280-284, pl. 29, figs. 13, 14.

Host.—Machetes pugnax.

### HYMENOLEPIS BRASILIENSIS Fuhrmann, 1906.

For description see Fuhrmann, 1906b, p. 446, fig. 26.

Host.—Antrostomus carolinensis.

# \* HYMENOLEPIS CANTANIANA (Polonio, 1860) Ransom, 1909.

For description see Ransom, 1909, pp. 36-41, figs. 28, 29 (the present paper).

Hosts.— Meleagris gallopavo domestica, \*Pavo cristatus, \*Gallus gallus domesticus, Phasianus colchicus.

#### HYMENOLEPIS CAPILLARIS (Rudolphi, 1810) Fuhrmann, 1906.

For description see Krabbe, 1869b, p. 307, pl. 7, fig. 179 (Tania capillaris).

Hosts.—Gavia stellata, Gavia arctica, Gavia immer, Colymbus auritus.

#### HYMENOLEPIS CAPILLAROIDES Fuhrmann, 1906.

For description see Fuhrmann, 1906b, pp. 355-356, figs. 6, 7.

Host.—Colymbus dominicus.

### \* HYMENOLEPIS CARIOCA (Magalhaes, 1898) Ransom, 1902.

For description see Ransom, 1902a, pp. 151-158, pl. 23, figs. 1-7; pl. 24, figs. 8-10: 1905b, pp. 274-276, figs. 3, 10, 22, 28.

Host.—\*Gallus gallus domesticus.

a See discussion under Dilepis unilateralis (p. 72).

HYMENOLEPIS CLANDESTINA (Creplin in Krabbe, 1869) Cohn, 1904.
For description see Krabbe, 1869b, p. 316, pl. 8, figs. 208, 209 (Tænia clandes-

tina).—Сони, 1904, pp. 243-246, pl. 11, figs. 9-12.

Host.—Hæmatopus ostralegus.

pp. 323-325 (Hymenolevis sinuosa).

HYMENOLEPIS COLLARIS (Batsch, 1786) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 298-299, pl. 7, figs. 151-153 (*Txnia sinuosa*).—Stiles, 1896f, pp. 40-41, pl. 10, figs. 116-124; pl. 11, figs. 125-139; pl. 12, figs. 140-146; pl. 13, fig. 153 (*Drepanidotxnia sinuosa*).—Cohn, 1901b,

Hosts.—Dafila acuta, Mareca penelope, Anas platyrhynchos, Anas platyrhynchos domestica, Anser anser, Anser anser domesticus.

HYMENOLEPIS COMPRESSA (Linton, 1892) Fuhrmann, 1906.

For description see Linton, 1892l, pp. 108-110, pl. 8, figs. 83-92 (*Tænia compressa*).—Kowalewski, 1907, p. 775, pl. 23, figs. 7-11; 1908, pp. 638-641; pl. 20, figs. 7-11.

Hosts.—Oidemia americana, Aristonetta valisineria, Marila marila.

HYMENOLEPIS CORONULA (Dujardin, 1845) Cohn, 1901.

For description see Krappe 1860b pp. 317-318 pl. 8 for 216-2

For description see Krabbe, 1869b, pp. 317-318, pl. 8, figs. 216-219 (Txnia coronula).—Stiles, 1896f, p. 33, pl. 3, figs. 21-28 (Dicranotxnia coronula).—Wolffhügel, 1900a, pp. 165-175, figs. 97-105 (Dicranotxnia coronula).—Linstow, 1905dd, p. 5, pl. 1, figs. 16-18 (H. megalhystera).

Hosts.—Harelda hyemalis, Clangula clangula, Marila marila, Mareca penelope, Anas platyrhynchos, Anas platyrhynchos domestica, Anser anser.

HYMENOLEPIS CREPLINI (Krabbe, 1869).

For description see Krabbe, 1869b, p. 317, pl. 8, figs. 214, 215, (*Tænia creplini*).—Cohn, 1901b, pp. 304–307, pl. 30, figs. 31–33.

Hosts.—Anser anser, Anser albifrons, Cygnus olor, Olor cygnus.

HYMENOLEPIS ECHINOCOTYLE Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 532-533, figs. 37, 38.

Host.—Spatula clypeata.

HYMENOLEPIS EXILIS a (Dujardin, 1845) Fuhrmann, 1906.

For description see DUJARDIN, 1845a, p. 602 (Tania exilis).—Stiles, 1896f, p. 58 (Tania exilis).

Host.—Gallus gallus domesticus.

HYMENOLEPIS FALLAX (Krabbe, 1869) Cohn, 1901.

For description see KRABBE, 1869b, p. 319, pl. 8, figs. 221, 222 (Tania fallax).

Hosts.—Somateria mollissima, Marila marila, Mareca penelope.

HYMENOLEPIS FARCIMINOSA (Goeze, 1782).

For description see Krabbe, 1869b, pp. 321-322, pl. 9, figs. 230-232 (Tania farciminalis).—Volz, 1900, pp. 32-35, pl. 2, fig. 10 (Diplacanthus farciminalis)

Host.—Sturnus vulgaris.

<sup>&</sup>lt;sup>a</sup> This species is perhaps identical with *Hymenolepis carioca*, but the original description is so incomplete that this question can not be settled.

#### HYMENOLEPIS FASCICULATA, new name.

For description see Krabbe, 1869b, p. 300, pl. 7, figs. 156, 157 (*Tænia fasciata*).—Stiles, 1896f, pp. 37-38, pl. 5, figs. 56-66; pl. 6, figs. 67-76; pl. 7, figs. 77-79 (*Drepanidotænia fasciata*).—Cohn, 1901b, p. 329.—Clerc, 1903, p. 307 (*Drepanidotænia fasciata*).

Hosts.—Mareca penelope, Anser anser, Anser anser domesticus, Anser albifrons.

#### HYMENOLEPIS FRAGILIS (Krabbe, 1860) Fuhrmann, 1906.

For description see Krabbe, 1869b, pp. 300-301, pl. 7, figs. 158-160 (Txnia fragilis).—Fuhrmann, 1906b, pp. 747-748, figs. 11-12.

Hosts.—Nettion crecca, Chaulelasmus streperus.

### HYMENOLEPIS PASSERIS (Gmelin, 1790).

For description see Krabbe, 1869b, pp. 326-327, pl. 9, figs. 245-247 (Txnia fringillarum).

Hosts.—Passer domesticus, Passer montanus, Ægiothus linaria.

#### HYMENOLEPIS FURCIFERA (Krabbe, 1869).

For description see Krabbe, 1869b, p. 306, pl. 7, figs. 176-178 (*Tænia furcifera*).—Szymanski, 1904a, p. 344, pl. 8, figs. 6, 7 (*Tænia furcifera*); 1905b, p. 734, pl. 16, figs. 6, 7 (*Tænia furcifera*).—Linstow, 1908, pp. 38-39, figs. 1, 2.

Host.—Colymbus auritus.

## HYMENOLEPIS FUSUS (Krabbe, 1869) Fuhrmann, 1906.

For description see KRABBE, 1869b, pp. 307-308, pl. 7, figs. 180, 181 (Txnia fusus).

Hosts.—Larus huperboreus, Larus marinus,

#### HYMENOLEPIS GRACILIS (Zeder, 1803) Cohn, 1901.

For description see Krabbe, 1869b, p. 299, pl. 7, figs. 154, 155 (*Tænia gracilis*).—Stiles, 1896f, pp. 38-39, pl. 7, figs. 80-91; pl. 8, figs. 92-99 (*Drepanidotænia gracilis*).—Wolffhügel, 1900a, pp. 176-183, figs. 106-109 (*Drep. gracilis*).—Cohn, 1901b, pp. 327-329.—Clerc, 1903, pp. 305-306 (*Drep. gracilis*).

Hosts.—Mergus serrator, Marila marila, Spatula clypeata, Nettion crecca, Mareca penelope, Chaulelasmus streperus, Anas platyrhynchos, Anas platyrhynchos domestica, Anser anser domesticus.

#### HYMENOLEPIS GRŒNLANDICA (Krabbe, 1869) Fuhrmann, 1906.

For description see Krabbe, 1869b, p. 316, pl. 8, figs. 210, 211 (Txnia granlandica).

Host.—Harelda hyemalis.

### HYMENOLEPIS HIMANTOPODIS (Krabbe, 1869) Fuhrmann, 1906.

For description see Krabbe, 1869b, pp. 309-310, pl. 8, fig. 190 (*Txnia himantopodis*).—Fuhrmann, 1906b, pp. 748-749, fig. 13.

Host.—Himantopus mexicanus.

### HYMENOLEPIS INTERRUPTA (Rudolphi, 1802) Fuhrmann, 1906.

For description see Fuhrmann, 1906b, pp. 745-746, fig. 8.

Host.—Scolopax rusticola.

<sup>&</sup>lt;sup>a</sup> New name for Tænia fasciata Rudolphi of Krabbe, 1869. Tænia fasciata Rudolphi, 1810=Tænia setigera Frölich, 1789.

HYMENOLEPIS LANCEOLATA (Bloch, 1782) Weinland, 1858.

For description see STILES, 1896f, pp. 36-37, pl. 4, figs. 43-53; pl. 5, figs. 54, 55 (Drepanidotænia lanceolata).—Clerc, 1903, pp. 302-303, pl. 8, fig. 4 (Drep. lanceolata).—RANSOM, 1904d, pp. 14, 101-110, figs. 108-130.

Hosts.—Netta rufina, Cairina moschata, Anas rubripes, Anas platyrhynchos domestica, Branta bernicla, Anser anser, Anser anser domesticus. Olor cygnus.

HYMENOLEPIS LINEA (Goeze, 1782) Wolffhügel, 1899.

For description see Krabbe, 1869b, pp. 327-328, pl. 9, figs. 248, 249 (Txnia linea).—Wolffhügel, 1900a, pp. 189-190, pl. 7, fig. 112.

Host.—Coturnix coturnix.

HYMENOLEPIS LIOPHALLOS (Krabbe, 1869) Fuhrmann, 1906.

For description see KRABBE, 1869b, p. 291, pl. 6, fig. 122 (Tania liophallos).

Host.—Olor cygnus.

HYMENOLEPIS LONGIVAGINATA Fuhrmann, 1906.

For description see Fuhrmann, 1906b, pp. 752-753, fig. 19.

Host.—Branta leucopsis.

HYMENOLEPIS MACRACANTHOS (Linstow, 1877) Fuhrmann, 1906.

For description see Linstow, 1877a, pp. 16-17, pl. 1, fig. 24 (Tania macracanthos).

Host.—Clangula clangula.

\* HYMENOLEPIS MEGALOPS (Nitzsch in Creplin, 1829) Parona, 1899.

For description see Ransom, 1902a, pp. 158-167, pl. 24, figs. 11-14; pl. 25, figs. 15-20.

Hosts.— Marila marila, Cairina moschata, Nettion crecca, \*Dafila acuta, Anas platyrhynchos domestica, Olor cygnus.

HYMENOLEPIS MELEAGRIS (Clerc, 1902) Fuhrmann, 1906.

For description see Clerc, 1902a, pp. 574-575 (Drepanidotænia meleagris); 1903, p. 306 (un Cestode dans Meleagris gallopavo).

Host.— Meleagris gallopavo domestica.

HYMENOLEPIS MICRANCRISTROTA (Wedl, 1856) Fuhrmann, 1906.

For description see Krabbe, 1869b, p. 318, pl. 8, fig. 220 (Txnia micrancristrota).

Host.—Olor cygnus.

HYMENOLEPIS MICROCEPHALA (Rudolphi, 1819) Fuhrmann, 1906.

For description see Krabbe, 1869b, p. 310, pl. 8, figs. 191, 192 (Tania microcephala).—Cohn, 1904, pp. 246-248, pl. 11, figs. 13-16 (Tania multiformis).

Host.—Nycticorax nycticorax, Ardea cinerea, Plegadis autumnalis.

HYMENOLEPIS MICROPS (Diesing, 1850) Fuhrmann, 1906.

For description see Wolffhügel, 1900a, pp. 191-192, fig. 110 (H. tetraonis).

Host.—Centrocercus urophasianus?a

<sup>&</sup>lt;sup>a</sup>Leidy (1887a, p. 1) identified tapeworms from this host as *Tænia microps* Diesing. but according to Fuhrmann (1908a, p. 103) they are probably a species of *Davainea*.

### HYMENOLEPIS MICROSOMA (Creplin, 1829) Cohn, 1901.

For description see Krabbe, 1869b, pp. 296-298, pl. 6, figs. 146-150 (Tænia microsoma).—Cohn, 1901b, pp. 284-288, pl. 29, figs. 15-22.

Hosts.—Oidemia fusca, Somateria spectabilis, Somateria mollissima, Harelda hyemalis. Marila marila, ? Larus hyperboreus.

#### HYMENOLEPIS MINOR, new name.ª

For description see Krabbe, 1869b, p. 292, pl. 6, figs. 127-129 (Tania minuta).

Host.—Lobipes lobatus.

# HYMENOLEPIS MUSCULOSA (Clerc, 1902) Fuhrmann, 1906.

For description see CLERC, 1903, pp. 303-305, pl. 8, figs. 17, 23; pl. 9, figs. 29, 35 (Drepanidotxnia musculosa).

Host.— Meleagris gallopavo domestica.

### HYMENOLEPIS OCTACANTHA (Krabbe, 1869) Fuhrmann, 1906, not Cohn, 1901.

For description see Krabbe, 1869b, p. 301, pl. 7, figs. 161, 162 (Tania octacantha).—Fuhrmann, 1906b, pp. 746-747, figs. 9, 10.

Hosts.—Spatula clypeata, Nettion crecca, Dafila acuta, Chaulelasmus streperus, Anas platyrhynchos.

#### HYMENOLEPIS ORIENTALIS (Krabbe, 1879) Fuhrmann, 1906.

For description see Krabbe, 1879a, p. 11, figs. 50-52 (Txnia orientalis); 1882a, p. 360, pl. 2, figs. 43, 44 (T. orientalis).

Host.—Saxicola ananthe.

### HYMENOLEPIS PACHYCEPHALA (Linstow, 1872) Fuhrmann, 1906.

For description see Linstow, 1872d, p. 55, pl. 3, figs. 2-4 (*Txnia pachycephala*); 1904n, p. 305, pl. 13, figs. 17-20 (*Drepanidotxnia pachycephala*).

Host.—Colymbus auritus, Histrionicus histrionicus.

#### HYMENOLEPIS PAPILLATA Fuhrmann. 1006.

For description see Fuhrmann, 1906b, pp. 357-358, figs. 10, 11.

Host.—Cairing moschata.

#### HYMENOLEPIS PARVULA Kowalewski, 1904.

For description see Kowalewski, 1905a, pp. 9-16, pl. 7, figs. 10-17; 1905b, pp. 533-534, pl. 14, figs. 10-17.

Host.—Anas platyrhynchos domestica.

#### HYMENOLEPIS PHASIANINA Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 533-534, figs. 40, 41.

Host.—Phasianus colchicus.

# HYMENOLEPIS PIGMENTATA (Linstow, 1872) Fuhrmann, 1906.

For description see Linstow, 1872d, p. 56, pl. 3, figs. 7, 8 (Tania pigmentata).

Host.—Marila marila.

<sup>&</sup>lt;sup>a</sup> New name for Tænia minuta Krabbe, 1869, not Tænia minuta Braun in Rudolphi, 1810.

#### HYMENOLEPIS POCULIFERA (Linstow, 1870) Fuhrmann, 1906.

For description see Linstow, 1879a, pp. 186-187, pl. 12, figs. 37, 38 (Tania poculifera).

Host. — Fulica atra.

## HYMENOLEPIS PODICIPINA Szymanski, 1904.

For description see Szymanski, 1904a, pp. 342-344, pl. 8, figs. 1-5; 1905b, pp. 733-734, pl. 16, figs. 1-5.

Host.—Colymbus auritus.

## HYMENOLEPIS RECTACANTHA Fuhrmann, 1006.

For description see Fuhrmann, 1906b, pp. 446-447, fig. 27.

Host.—Ægialitis hiaticula.

### HYMENOLEPIS RETRACTA Linstow, 1905.

For description see Linstow, 1905dd, p. 4, pl. 1, fig. 15.

Host.—Somateria spectabilis.

## · HYMENOLEPIS ROSTELLATA (Abildgaard, 1790) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 286-287, pl. 5, figs. 112, 113 (*Tænia capitellata*).—Fuhrmann, 1896k, pp. 443-449, pl. 14, figs. 5-10 (*Tænia capitellata*).

Hosts.—Gavia stellata, Gavia arctica, Gavia immer.

#### HYMENOLEPIS RUGOSA Clerc, 1906.

For description see Clerc, 1906a, pp. 433-434, figs. 1-4.

Host.—Columba livia.

## HYMENOLEPIS SAGITTA (Rosseter, 1906) Fuhrmann, 1908.

For description see Rosseter, 1906b, pp. 275-278, 1 pl. (Drepanidotænia sagitta).

Host.—Anas platyrhynchos domestica.

### HYMENOLEPIS SERPENTULUS (Schrank, 1788) Weinland, 1858.

For description see Volz, 1900, pp. 135-140, pl. 7, fig. 8 (*Diplacanthus serpentulus*).—Cohn, 1901b, pp. 294-297, pl. 29, figs. 23, 24; pl. 30, fig. 25, 1 text figure.—Clerc, 1903, pp. 295-296, pl. 8, fig. 8 (*Drepanidotænia serpentulus*).

Hosts.—?Planesticus migratorius, Pica pica, Corvus corax.

## HYMENOLEPIS SETIGERA (Frölich, 1789) Cohn, 1901.

For description see Krabbe, 1869b, pp. 289-290, pl. 6, figs. 117-121 (Txnia setigera).—Stiles, 1896f, pp. 41-42, pl. 12, figs. 147-150; pl. 13, figs. 154-164 (Drepanidotxnia setigera).—Clerc, 1903, pp. 298-302, pl. 8, figs. 3, 6, 7, 12, 22 (Drepanidotxnia setigera).

Hosts.—Branta bernicla, Branta leucopsis, Anser anser, Anser fabalis, Cygnus olor domesticus, Olor cygnus.

#### HYMENOLEPIS SIBIRICA (Linstow, 1905) Fuhrmann, 1908.

For description see Linstow, 1905dd, pp. 6-7, pl. 1, fig. 22 (Diorchis sibirica).

Host.—Somateria spectabilis.

### HYMENOLEPIS SPHÆROPHORA (Rudolphi, 1810) Fuhrmann, 1906.

For description see Rudolphi, 1810a, pp. 119-120 (Tania spharophora).—Cobbold, 1858b, p. 164, pl. 33, figs. 63-67 (T. spharophora).

Hosts.—Gallinago gallinago, Scolopax rusticola.

#### HYMENOLEPIS COLUMBÆ (Zeder, 1800).

For description see Fuhrmann, 1906b, pp. 449-450, figs. 34, 35 (H. sphenocephala).

Host.—Columba livia domestica.

#### HYMENOLEPIS STYLOSA (Rudolphi, 1810) Volz. 1899.

For description see Krabbe, 1869b, p. 326, pl. 9, figs. 242-244 (Txnia stylosa).—Volz, 1900, pp. 141-144, pl. 7, fig. 9 (Diplacanthus stylosus).

Hosts.—Pica pica, Corvus corax.

## HYMENOLEPIS TENERRIMA (Linstow, 1882) Fuhrmann, 1906.

For description see Linstow, 1882a, p. 21, pl. 2, fig. 26 (Txnia tenerrima).

Host - Marila marila

## HYMENOLEPIS TENUIROSTRIS (Rudolphi, 1819) Cohn, 1901.

For description see Krabbe, 1869b, pp. 291-292, pl. 6, figs. 123-126 (Tania tenuirostris).—Stiles, 1896f, p. 43, pl. 14, figs. 165-172 (Drepanidotania tenuirostris).—Cohn, 1901b, pp. 326-327.

Hosts.— Mergus serrator, Mergellus albellus, Oidemia fusca, Somateria mollissima, Marila marila, Anas platyrhynchos domestica, Anser anser domesticus.

## HYMENOLEPIS TERESOIDES Fuhrmann, 1906.

For description see Fuhrmann, 1906b, pp. 443-444, fig. 20.

Host.—Chaulelasmus streperus.

#### HYMENOLEPIS TRIFOLIUM Linstow, 1906.

For description see Linstow, 1905t, pp. 361-362, pl. 23, figs. 6, 7.

Host.—Anas platyrhynchos.

#### HYMENOLEPIS ULIGINOSA (Krabbe, 1882) Fuhrmann, 1906.

For description see KRABBE, 1882a, p. 355, pl. 1, figs. 25-27 (Txnia uliginosa).

Host.—Numenius phæopus.

#### HYMENOLEPIS VALLEI (Stossich, 1892) Fuhrmann, 1906.

For description see Stossich, 1892b, pp. 68-69, pl. 1, figs. 3, 4 (Tania vallei).

Host.—?Pisobia damacensis.

## HYMENOLEPIS VENUSTA (Rosseter, 1897).

For description see Rosseter, 1898a, pp. 10-23, pls. 1, 2, figs. 1-17 (Drepanidotenia venusta).

Host.—Anas platyrhynchos domestica.

#### HYMENOLEPIS VILLOSA (Bloch, 1782) Wolffhügel, 1899.

For description see Krabbe, 1869b, pp. 303-304, pl. 7, figs. 168, 169 (*Tænia villosa*); 1882a, pp. 354-355, pl. 1, figs. 19-22 (*Tænia villosa*).—Wolffhügel, 1900a, pp. 184-188, pl. 7, fig. 11.

Host.—?Gallus gallus domesticus.

#### HYMENOLEPIS, species Cohn.

For description see Cohn, 1901b, pp. 312-319, pl. 31, figs. 38, 39.

Host.— Marila marila.

3264—Bull. 69—09—-7

#### Subgenus ECHINOCOTYLE Blanchard, 1891.

Subgeneric diagnosis.—Hymenolepis: Rostellum armed with a single crown of ten slender hooks with dorsal root and blade about equal in length and ventral root rudimentary. Suckers large, flat, armed on the borders and in the middle with small hooklets. A sacculus accessorius always present. Adults in birds.

Type-species.—Echinocotyle rosseteri Blanchard, 1891.

### ECHINOCOTYLE NITIDA (Krabbe, 1869) Clerc, 1902.

For description see Krabbe, 1869b, p. 294, pl. 6, figs. 133-135 (*Tænia nitida*).—Clerc, 1903, pp. 310-315, pl. 9, figs. 26, 27, 30, 31, 36, 38, 40-42.

Hosts.—Limosa limosa, Pisobia damacensis, Pelidna alpina, Arquatella maritima, Gallinago gallinago.

## ECHINOCOTYLE NITIDULANS (Krabbe, 1882) Fuhrmann, 1906.

For description see KRABBE, 1882a, p. 353, pl. 1, figs. 16, 17 (Tania nitidulans).

Hosts.—Ægialitis hiaticula, Pelidna alpina.

#### ECHINOCOTYLE ROSSETERI Blanchard, 1891.

For description see Blanchard, 1891t, pp. 424-428, figs. 1-3.—Stiles, 1896f, pp. 55-56, pl. 19, figs. 247-251.

Host.—Anas platyrhynchos domestica.

## Genus DIORCHIS Clerc, 1903.

Generic diagnosis.—Hymenolepidinæ: Rostellum with a single crown of ten hooks with long dorsal and short ventral roots or exceptionally with very short dorsal root and with ventral root nearly as long as the blade. Surface of suckers may be armed with minute spines. Inner longitudinal muscle layer consisting of 8 bundles, 4 dorsal and 4 ventral. Two testicles in each segment. Adults in birds.

Type-species.—Diorchis acuminata (Clerc, 1902) Clerc, 1903.

#### \* DIORCHIS ACUMINATA (Clerc, 1902) Clerc, 1903.

For description see Clerc, 1903, pp. 281-284, pl. 9, fig. 25; pl. 11, figs. 78, 88.—Ransom, 1909, pp. 42-48, figs. 30-36 (the present paper).

Hosts.—Nettion crecca, Mareca penelope, Chaulelasmus streperus, Fulica atra, \*Fulica americana.

### \* DIORCHIS AMERICANA Ransom, 1909.

For description see Ransom, 1909, pp. 48-51, figs. 37-42 (the present paper).

Host.—\* Fulica americana.

#### DIORCHIS INFLATA (Rudolphi, 1819) Clerc, 1903.

For description see Krabbe, 1869b, pp. 285-286, pl. 5, figs. 109-111 (Txnia inflata).—Jacobi, 1898c, pp. 95-104, 1 pl. (T. inflata).—Cohn, 1901b, pp. 330-331 (Hymenolepis inflata).—Clerc, 1903, pp. 284-288, pl. 11, fig. 89.—Linstow, 1906, pp. 15-17, pl. 1, figs. 17, 18 (H. inflata).

Host.—Fulica atra.

DIORCHIS PARVICEPS (Linstow, 1872) Linstow, 1904.

For description see Linstow, 1872d, p. 57, pl. 3, figs. 11, 12 (*Tænia parviceps*); 1904n, pp. 306-307, pl. 13, figs. 23-25.

Host.—Mergus serrator.

### Genus APLOPARAKSIS Clerc, 1903.

Monorchis Clerc, 1902 (type, M. filum (Goeze, 1782); not Monorchis, Trematoda). Skorikowia Linstow, 1905 (type, S. clausa Linstow, 1905—Aploparaksis brachyphallos (Krabbe). (See Fuhrmann, 1908a, p. 82).

Generic diagnosis.—Hymenolepidinæ: Strobila small and slender. Rostellum armed with a single crown of hooks, with ventral root as long or nearly as long as the blade. Suckers unarmed. One testicle, dorsal. Seminal vesicle large. Adults in birds.

Type-species.—Aploparaksis filum (Goeze, 1782) Clerc, 1903.

### APLOPARAKSIS BIRULAI Linstow, 1905.

For description see Linstow, 1905dd, p. 8, pl. 2, figs. 26-28.

Host.—Somateria spectabilis.

## APLOPARAKSIS BRACHYPHALLOS (Krabbe, 1869) Fuhrmann, 1908.

For description see Krabbe, 1869b, pp. 310-311, pl. 8, figs. 193, 194 (Tænia brachyphallos).

Hosts.—Aegialitis hiaticula, Calidris leucophæa, Pisobia damacensis, Pelidna alpina, Arquatella maritima, Tringa canutus.

### APLOPARAKSIS CIRROSA (Krabbe, 1869) Clerc, 1903.

For description see Krabbe, 1869b, p. 308, pl. 7, figs. 182–185 (*Tænia cirrosa*).— Clerc, 1903, pp. 269–271, pl. 8, fig. 14.

Hosts.—Larus canus, Larus minutus, Sterna hirundo.

### APLOPARAKSIS CRASSIROSTRIS (Krabbe, 1869) Clerc, 1903.

For description see Krabbe, 1869b, p. 314, pl. 8, figs. 202-204 (Txnia crassirostris).—Clerc, 1903, pp. 265-267, pl. 8, fig. 20.

Hosts.—Hæmatopus ostralegus, Squatarola squatarola, Aegialitis hiaticula, Machetes pugnax, Pisobia damacensis, Pelidna alpina, Gallinago gallinago, Scolopax rusticola, Lobipes lobatus.

## APLOPARAKSIS DIMINUENS Linstow, 1905.

For description see Linstow, 1905dd, pp. 8-9, pl. 2, figs. 29-31.

Host.—Phalaropus fulicarius.

### APLOPARAKSIS DUJARDINII (Krabbe, 1869) Clerc, 1903.

For description see Krabbe, 1869b, pp. 319-320, pl. 9, figs. 223-225 (*Tænia dujardini*i).—Fuhrmann, 1896k, pp. 436-442, pl. 14, figs. 1-4 (*Tænia dujardini*).—Clerc, 1903, pp. 274-275 (*A. dujardini*).

Hosts.—Sturnus vulgaris, Turdus musicus.

### APLOPARAKSIS FILUM (Goeze, 1782) Clerc, 1903.

For description see Krabbe, 1869b, pp. 312-313, pl. 8, figs. 198-201 (*Txnia filum*).—Clerc, 1903, pp. 257-263, figs. 1, 2, pl. 8, figs. 11, 15.

Hosts.—Arenaria interpres, Limosa limosa, Totanus totanus, Helodromas ochropus, Machetes pugnax, Pisobia damacensis, Pelidna alpina, Gallinago media, Gallinago gallinago, Scolopax rusticola, Lobipes lobatus.

APLOPARAKSIS FURCIGERA (Rudolphi, 1819) Fuhrmann, 1908.

For description see Krabbe, 1869b, p. 315, pl. 8, figs. 205-207 (*Tænia rhomboidea*).—Stiles, 1896f, pp. 34-35, pl. 3, figs. 31-34 (*Dicranotænia furcigera*).

Hosts.—Nettion crecca, Anas platyrhynchos.

APLOPARAKSIS PENETRANS (Clerc, 1902) Clerc, 1903.

For description see Clerc, 1903, pp. 271-274, pl. 8, figs. 10, 18, 19.—Kowalewski, 1907, p. 774, pl. 23, figs. 1-6; 1908, pp. 633-638, pl. 20, figs. 1-6.

Hosts.—Pisobia damacensis, Gallinago gallinago.

APLOPARAKSIS PUBESCENS (Krabbe, 1882).

For description see Krabbe, 1882a, p. 355 (*Tænia pubescens*), pl. 1, figs. 23, 24, pl. 8, figs. 1, 5 (*T. hirsuta*).

Hosts.—Helodromas ochropus, Scolopax rusticola.

# Family TÆNIIDÆ Ludwig, 1886.

Family diagnosis.—Tænioidea: Scolex usually with well developed rostellum armed with a double crown of hooks, rarely with rudimentary unarmed rostellum. Suckers unarmed. Gravid segments longer than broad. A single set of reproductive organs in each segment. Genital pores irregularly alternate. Vas deferens coiled, seminal vesicle absent. Testicles numerous, usually very numerous, scattered throughout the medullary parenchyma, except in the posterior median portion occupied by the double ovary, posterior of which is the yolk gland. Uterus with median stem, and when fully developed with lateral branches. Egg with a thin outer membrane, and a thick brown radially striated inner shell. Adults in mammals and birds.

Type-genus.—Tænia Linnæus, 1758.

#### Genus TÆNIA Linnæus, 1758.

Cladotænia <sup>a</sup> Cohn, 1901 (type, C. globifera (Batsch, 1786)=Tænia cylindracea Bloch, 1782; see Fuhrmann, 1906a, p. 220; 1907a, p. 293; 1908a, p. 84).

Generic diagnosis.—Tæniidæ: With the characters of the family. Adults in mammals and birds.

Type-species.—Tænia solium Linnæus, 1758.

TÆNIA CYLINDRACEA Bloch, 1782.

For description see Morell, 1895b, pp. 87-92, pl. 7, figs. 5-7 (*T. globifera*).—Volz, 1900, pp. 157-160, pl. 8, fig. 14 (*T. globifera*); pp. 161-163, pl. 8, figs. 15, 16 (*T. armigera*).—Cohn, 1901b, pp. 373-380, pl. 32, figs. 51-53; pl. 33, figs. 55, 56 (*Cladotænia globifera*).

Hosts.—Cerchneis tinnunculus, Falco æsalon, Falco peregrinus, Haliæetus albicilla.

TÆNIA CONSCRIPTA Railliet and Henry, 1909.

For description see Kowalewski, 1895a, p. 359, pl. 8, fig. 27 (*Tænia krabbei*).—Stiles, 1896f, pp. 42-43, pl. 12, figs. 151, 152 (*Tænia krabbei*).

Host.—Anser anser domesticus.

a For earlier synonyms of Txnia, see Stiles, 1906a, p. 36.

# Genus DIPLOPOSTHE Jacobi, 1896.

Generic diagnosis.—Tenioidea: Closely related to the Acoleidee (according to Fuhrmann, 1907a, p. 294; 1908a, p. 85). Scolex with rostellum armed with a single crown of ten books. Suckers unarmed. Inner longitudinal muscle layer, except for two or three small bundles in the lateral portion beyond the excretory vessels, developed only in the median portion of the segment, consisting of about ten dorsal and ten ventral bundles of unequal size. Outer longitudinal muscle layer of numerous equally developed bundles, interrupted only at the sides where the genital canals pass through. Outside the outer longitudinal layer a thin layer of diagonal fibers, and at the posterior end of the segment a well-developed muscle ring. Genital pores marginal. one on each side of the segment. Testicles few (3 to ? 7), in the posterior portion of the segment. Vasa efferentia unite to form two vasa deferentia. Seminal vesicles present. Cirri two, one on each side of the segment, armed with strong hooks. A single set of female glands in the median field. Ovary bilobed: behind it, near the posterior border of the segment, the yolk gland. Two vaginæ. Uterus saclike, transversely elongated, with large diverticula, which push through the musculature dorsally and ventrally, and also extend forward to the anterior border of the segment. Eggs with three thin transparent envelopes. Adults in birds.

Type-species.—Diploposthe lævis (Bloch, 1782, of Diesing, 1850) Jacobi, 1896.

### DIPLOPOSTHE LÆVIS (Bloch, 1782) Jacobi, 1896.

For description see Krabbe, 1869b, pp. 302-303, pl. 7, figs. 165-167 (*Tænia lævis*).—
Jacobi, 1897a, pp. 287-306, pls. 26, 27.—Cohn, 1901b, pp. 421-430, pl. 35, figs. 81-85.—Fuhrmann, 1905a, pp. 217-224.

Hosts.—Clangula clangula, Marila marila, Netta rufina, Spatula clypeata, Nettion crecca, Chaulelasmus streperus, Anas rubripes, Anas platyrhynchos, Anas platyrhynchos domestica, Branta canadensis.

## Family ACOLEIDÆ (emended name).

Acoleinæ Fuhrmann, 1900. "Acoleinidæ" Fuhrmann, 1907.

Family diagnosis.—Tænioidea: Scolex generally armed, seldom without rostellum. Suckers unarmed. Strobila thick, with short segments. Musculature consists of at least two layers of longitudinal muscles alternating with layers of transverse muscles. A single set, double set, or partial duplication of reproductive organs in each segment. Male genital openings marginal. Female genital (vaginal) openings lacking. Cirrus always very large and armed with strong hooks or spines. Egg with thin transparent shells. Adults in birds.

Type-genus.—Acoleus Fuhrmann, 1899.

### Genus ACOLEUS Fuhrmann, 1899.

Generic diagnosis.—Acoleidée: Scolex with armed rostellum. A single set of reproductive organs in each segment. Male genital pores regularly alternate. Cirrus pouch passes ventral of longitudinal excretory vessels and nerve. Testicles numerous. Vagina functions as a very large seminal receptacle. Adults in birds.

Type-species.—Acoleus armatus Fuhrmann, 1899 = Acoleus vaginatus (Rudolphi, 1819) Fuhrmann, 1900.

ACOLEUS VAGINATUS (Rudolphi, 1819) Fuhrmann, 1900.

For description see Fuhrmann, 1899e, pp. 620-622, figs. 4-6 (A. armatus); 1899g, pp. 347-350, pl. 17, figs. 10-14 (A. armatus); 1900c, pp. 369-370.

Host.—Himantopus mexicanus.

### Genus GYROCŒLIA Fuhrmann, 1899.

Brochocephalus Linstow, 1906 (type, B. paradoxus Linstow, 1906; see Fuhrmann, 1908a, p. 86).

Generic diagnosis.—Acoleidæ: Rostellum armed with a single crown of hooks arranged in a zigzag row having eight angles. A single set of reproductive organs in each segment. Male pores irregularly alternate. Cirrus pouch passes between the longitudinal excretory vessels and dorsal of the nerve. Testicles few. Seminal receptacle very small. Uterus ring-like with numerous outpocketings and with an opening in gravid segments dorsally and ventrally. Adults in birds.

Type-species.—Gyrocælia perversus Fuhrmann, 1899.

GYROCŒLIA PARADOXA (Linstow, 1906).

For description see Linstow, 1906, p. 183, pl. 2, figs. 36, 38; pl. 3, figs. 35, 37 (Brochocephalus paradoxus).a

Host.—Ægialitis mongola.

### Genus DIPLOPHALLUS Fuhrmann, 1900.

Generic diagnosis.—Acoleidæ: A double set of male reproductive organs and a single set of female organs in each segment. Two vaginæ functioning as large seminal receptacles. Adults in birds.

Type-species.—Diplophallus polymorphus (Rudolphi, 1819, partim Krabbe, 1869) Fuhrmann, 1900.

DIPLOPHALLUS POLYMORPHUS (Rudolphi, 1819) Fuhrmann, 1900.

For description see Krabbe, 1869b, pp. 301-302, pl. 7, figs. 163, 164 (*Tænia polymorpha*).—Wolffhügel, 1900a, pp. 136-152, pl. 5, figs. 67-80, pl. 6, figs. 81-84 (*Tænia polymorpha*).—Cohn, 1900c, pp. 277-288, pl. 15, figs. 19-22 (*Tænia polymorpha*).—Fuhrmann, 1900c, p. 371.

Host.—Himantopus mexicanus.

a Fuhrmann (1908a, p. 86) examined the original material of *Brochocephalus paradoxus* and found that this species belongs in *Gyrocælia* in spite of Linstow's different description.

### Genus SHIPLEYA a Fuhrmann, 1907.

Generic diagnosis.—Acoleidæ: Scolex without rostellum, but with apical papilla. Single set of reproductive organs in each segment. Male genital pores regularly alternate. Cirrus conical in shape, armed with large hooks. Yolk gland dorsal of ovary. Vagina represented only by a small seminal receptacle in central portion of segment. Uterus at first ring shaped, later becomes much branched. Adults in birds.

Type-species.—Shipleya inermis Fuhrmann, 1907.

## Genus DIOICOCESTUS Fuhrmann, 1900.

Generic diagnosis.—Acoleidæ: Diœcius, entire strobila male or female. Female thicker and broader than male. Male with a double set; female with a single set of reproductive organs in each segment. Irregularly alternating vagina reaches almost to the edge of the segment. Eggs with three envelopes. Adults in birds.

Type-species.—Dioicocestus paronai Fuhrmann, 1900.

#### DIOICOCESTUS ACOTYLUS Fuhrmann, 1904.

For description see Fuhrmann, 1904a, pp. 327-331; 1904b, pp. 131-148, pl. 10, figs. 2-11.

Host.—Columbus dominicus.

#### DIOICOCESTUS PARONAI Fuhrmann, 1900.

For description see Fuhrmann, 1900c, pp. 363-366, figs. 1-3.

Host.—Plegadis quarauna.

### Family AMABILIIDÆ (emended name).

"Amabilinida" Fuhrmann, 1907.

Family diagnosis.—Tænioidea: Scolex with armed rostellum; suckers usually unarmed. Segments with lateral appendages. A double or single set of reproductive organs in each segment. Male genital pores marginal. Vaginal opening lacking, replaced by the marginal, ventral, or dorsal opening of an accessory genital canal. Egg with thin transparent shells. Adults in birds.

Type-genus.—Amabilia Diamare, 1893.

### Genus AMABILIA Diamare, 1893.

Aphanobothrium Linstow, 1906 (type, A. catenatum Linstow, 1906; see Fuhrmann, 1908a, p. 88).

Generic diagnosis.—Amabiliidæ: Scolex very small with armed rostellum. A double set of male reproductive organs in each segment, with two pores, one on either side of the segment. Cirrus

<sup>&</sup>lt;sup>a</sup> This genus and its type-species mentioned by Fuhrmann in 1907 (1907a, p. 294), were described by him in 1908 (1908b, p. 70).

armed with strong spines. Testicles numerous, in median field. Female organs median, a single set in each segment. Uterus forming a cage-like meshwork consisting (Fuhrmann, 1908a, p. 88) of a dorso-ventral ring with dorso-ventral anastomoses. Accessory vagina opening ventrally, communicating (?) with a canal from the excretory system opening in the ventral surface of the segment in the median line. Adults in birds.

Type-species.—Amabilia lamelligera (Owen, 1832) Diamare, 1893

## Genus SCHISTOTÆNIA Cohn, 1900.

Generic diagnosis.—Amabiliidæ: Scolex with very large, armed rostellum. A single set of reproductive organs in each segment. Male genital pores irregularly alternate. Male deferent canal passes between the longitudinal excretory vessels. Testicles numerous, extending across the entire width of the segment. Vagina absent. Vaginal functions performed by a median, dorso-ventral canal (accessory vagina) opening on the surface of the segment dorsally and ventrally. Adults in birds.

Type-species.—Schistotænia macrorhyncha (Rudolphi, 1810) Cohn, 1900 = Schistotænia scolopendra (Diesing, 1850). (See Fuhrmann, 1907b, p. 534.)

### SCHISTOTÆNIA MACRORHYNCHA (Rudolphi, 1810) Cohn, 1900.

For description see Krabbe, 1869b, p. 305, pl. 7, fig. 172 (*Txnia macrorhyncha*).—Cohn, 1900c, pp. 265-277, pl. 14, figs. 8-18 (*S. macrorhyncha* and *S. scolopendra*).—Clerc, 1907, pp. 704-708, pl. 1, figs. 3-7.

Hosts.—Colymbus dominicus, Colymbus auritus.

### Genus TATRIA Kowalewski, 1904.

Generic diagnosis.—Amabiliidæ: Rostellum with a single crown of few large hooks at apex and with numerous rows of small spine-like hooks behind the crown of large hooks. Suckers and posterior portion of head covered with minute spines. Segments not numerous (about 30). A single set of reproductive organs in each segment. Male genital pores regularly alternate. Cirrus pouch large, ticles not numerous (7 in the type species). Male and female canals pass between the longitudinal excretory vessels. Distal end of vagina instead of opening to the exterior turns backward into the next following segment and opens into the seminal receptacle of that Seminal receptacles in median line of strobila. accessory vagina present in the opposite side of the segment from the cirrus pouch, sometimes with an opening in the margin of the seg-Adults in birds. ment.

Type-species.—Tatria biremis Kowalewski, 1904.

## TATRIA APPENDICULATA Fuhrmann, 1908.

For description see Fuhrmann, 1908b, p. 69, figs. 56, 57.

Host.—Colymbus dominicus.

#### TATRIA BIREMIS Kowalewski, 1004.

For description see Kowalewski, 1904c, pp. 284-304, pls. 5-6, figs. 1-21; 1904e, pp. 367-369, pl. 9, figs. 1-10; pl. 10, figs. 11-21.

Host.—Colymbus auritus.

## Family FIMBRIARIIDÆ Wolffhügel, 1898.

Family diagnosis.—Tænioidea: Scolex small, unstable, and frequently lost, with rostellum armed with a single row of hooks. Large pseudo-scolex. Strobila without segments, but with transverse grooves which produce an appearance of segmentation. Three pairs of longitudinal excretory vessels. Reproductive organs not segmentally arranged. Genital pores marginal, most of them opening on the same side of the segment. Testicles numerous, arranged in transverse rows. Uterus not persistent, breaking down into a large number of egg sacs. Egg with thin transparent shells. Adults in birds.

Type-genus.—Fimbriaria Frölich, 1802.

### Genus FIMBRIARIA Frölich, 1802.

Epision Linton, 1892 (type, Epision plicatus Linton, 1892).

Notobothrium Linstow, 1905 (type, Notobothrium arcticum Linstow, 1905= Fimbriaria fasciolaris Pallas; see Fuhrmann, 1908a, p. 90).

Generic diagnosis.—Fimbriariidæ: With the characters of the family.

Type-species.—Fimbriaria malleus Frölich, 1802 = Fimbriaria fasciolaris (Pallas, 1781) Wolffhügel, 1899.

### FIMBRIARIA FASCIOLARIS (Pallas, 1781) Wolffhügel, 1899.

For description see Wolffhügel, 1900a, pp. 67-135, figs. 1-66.

Hosts.— Mergus serrator, Oidemia americana, Oidemia fusca, Somateria mollissima, Harelda hyemalis, Clangula clangula, Marila marila, Netta rufina, Cairina moschata domestica, Spatula clypeata, Nettion crecca, Mareca penelope, Anas platyrhynchos, Anas platyrhynchos domestica, Anser anser domesticus, & Gallus gallus domesticus.

#### FIMBRIARIA PLANA Linstow, 1905.

For description see Linstow, 1905t, pp. 362-365, pl. 23, figs. 10-14.

Host.—Anas platyrhynchos.

### GENERA IMPERFECTLY KNOWN.

### Genus TETRACISDICOTYLA Fuhrmann, 1907.

Generic diagnosis.—Tænioidea: Scolex relatively large, without rostellum. In the posterior portion of each sucker a peculiar muscular organ simulating a pair of smaller suckers. Neck absent. Segmentation of the strobila indistinct. A single set of reproductive organs in each segment. Genital pores marginal, irregularly alternating. Cirrus pouch large. Vas deferens coiled. Testicles numerous. Vagina opens into the genital pore in front of cirrus pouch. Adults in birds.

Type-species.— Tetracisdicotyla macroscolecina Fuhrmann, 1907.

### TETRACISDICOTYLA MACROSCOLECINA Fuhrmann, 1907.

For description see Fuhrmann, 1907b, pp. 535-536, fig. 43.

Host.—Butorides virescens.

### Genus COPESOMA Sinitsin, 1896.

Generic diagnosis.—Tænioidea: Scolex with large rostellum. Genital pores irregularly alternate, in young segments ventral, in gravid segments marginal. Adults in birds.

Type-species.—Copesoma papillosum Sinitsin, 1896.

### COPESOMA PAPILLOSUM Sinitsin, 1896.

For description see Fuhrmann, 1901a, p. 761.

Host.—?Pisobia damacensis.

### IMPERFECTLY KNOWN SPECIES.

#### TÆNIA COLLICULORUM Krabbe, 1869.

For description see KRABBE, 1869b, p. 330, pl. 9, fig. 259.

Host.—Riparia riparia.

### TÆNIA CONICAª Molin, 1858.

For description see Molin, 1861c, pp. 253-254, pl. 7, figs. 1, 2.—Stiles, 1896f, pl. 3, figs. 35, 36.

Host.—Anas platyrhynchos.

#### TÆNIA DISTINCTA Lönnberg: 1889.

For description see LÖNNBERG, 1889a, pp. 12-13, figs. 3, 4.

Host.--Larus canus.

## TÆNIA FILUM b Goeze of Linton, 1892.

For description see Linton, 1892l, pp. 106-107, pl. 8, figs. 72-78.

Host.—Larus californicus.

a Part of Molin's original (Bureau of Animal Industry, No. 1390) shows the long, prominent rostellum, with marks indicating that at one time there were 10 hooks present.

b According to Fuhrmann (1908a, p. 126) this form is probably a *Hymenolepis*, possibly *H. fusus*.

#### TÆNIA LEUCKARTI Krabbe, 1869.

For description see Krabbe, 1869b, p. 337, pl. 10, figs. 268, 269.

Host.—Ardea cinerea.

### TÆNIA MACROCANTHA Linton, 1892.

For description see Linton, 1892l, p. 107, pl. 8, figs. 79-82.

Host.—Oidemia americana.

### TÆNIA MEGALORHYNCHA Krabbe, 1860.

For description see KRABBE, 1869b, p. 284, pl. 5, figs. 104, 105.

Host.—Arquatella maritima.

### TÆNIA MUSCICAPÆ Linstow.

Mentioned by Fuhrmann, 1908a, pp. 96, 173, 182.

Host.—Motacilla alba.

#### TÆNIA ODIOSA Leidv. 1887.

For description see Leidy, 1887a, pp. 5-6, figs. 9-11; 1904a, pp. 202-203, figs. 9-11.

Host.—Colinus virginianus.

### TÆNIA OPORORNIS Leidy, 1887.

For description see Leidy, 1887a, pp. 9-10, figs. 23-25; 1904a, pp. 206-207, figs. 23-25.

Host.—Oporornis formosa.

#### TÆNIA PESTIFERA Leidy, 1855.

For description see Leidy, 1855a, p. 443; 1887a, pp. 3-4, figs. 2-4; 1904a, pp. 76, 201, figs. 2-4.

Hosts.—Icteria virens, Dolichonyx oryzivorus.

## TÆNIA PLATYCEPHALA Rudolphi, 1810.

For description see RUDOLPHI, 1810a, p. 94; 1819a, p. 508.

Hosts.—Alauda arvensis, Saxicola ananthe, Anthus pratensis.

### TÆNIA SIMPLA Leidy, 1887.

For description see Leidy, 1887a, p. 8, fig. 18; 1904a, p. 205, fig. 18.

Host.—Antrostomus carolinensis.

### TÆNIA STRIGIS-ACADICÆ Leidy, 1855.

For description see Leidy, 1855a, p. 444; 1904a, p. 76.

Host.—Cryptoglaux acadica.

#### TÆNIA TETRABOTHRIOIDES Lönnberg, 1890.

For description see LÖNNBERG, 1890b, pp. 13-15.

Host.—Pelidna alpina.

### TÆNIA URNIGERA Leidy, 1887.

For description see Leidy, 1887a, pp. 4-5, figs. 5-8; 1904a, p. 202, figs. 5-8.

Host.— Molothrus ater.

### TÆNIA VEXATA Leidy, 1887.

For description see Leidy, 1887a, pp. 7-8, figs. 15, 16; 1904a, p. 204, figs. 15,16.

Host.—Phlæotomus pileatus.

## TÆNIA VIATOR Leidy, 1887.

For description see Leidy, 1887a, pp. 6-7, figs. 12-14; 1904a, p. 203, figs. 12, 14.

Host .-- Elanoides forficatus.

COMPENDIUM OF SPECIES PARASITIC IN NORTH AMERICAN BIRDS ARRANGED ACCORDING TO HOSTS

The scientific names of hosts have been selected for me by Mr. H. C. Oberholser, of the Bureau of Biological Survey, U. S. Department of Agriculture.

Species of tapeworms collected in this country of which I have examined specimens are indicated by an asterisk, and the names of the hosts in which they were found are similarly marked.

#### COLYMBIFORMES.

Gavia stellata (Pontoppidan). Tetrabothrius macrocephalus, p. 60. Hymenolepis capillaris, p. 91. rostellata, p. 96.

Gavia arctica (Linnæus). Tetrabothrius macrocephalus, p. 60. Hymenolepis capillaris, p. 91. rostellata, p. 96.

Gavia immer (Brünnich). Tetrabothrius macrocephalus, p. 60. Hymenolepis capillaris, p. 91. rostellata, p. 96.

Colymbus dominicus a Linnæus. Choanotenia bilateralis, p. 75. Humenolepis capillaroides, p. 91. Dioicocestus acotylus, p. 103. Schistotænia macrorhyncha, p. 104. Tatria appendiculata, p. 105. Colymbus auritus Linnæus. Tetrabothrius macrocephalus, p. 60. Hymenolepis capillaris, p. 91. furcifera, p. 93. podicipina, p. 96.

Schistotænia macrorhyncha, p. 104.

#### PROCELLARIFORMES.

Tetrabothrius heteroclitus, p. 60. Puffinus kuhli b (Boie). Tetrabothrius heteroclitus, p. 60. Priocella glacialoides (Smith). Tetrabothrius heteroclitus, p. 60. Daption capensis (Linnæus). Tetrabothrius heteroclitus, p. 60. Fulmarus glacialis (Linnæus). Tetrabothrius monticellii, p. 60.

Puffinus puffinus (Brünnich).

Diomedea exulans Linnæus. Tetrabothrius diomedeæ, p. 60. heteroclitus, p. 60. umbrella, p. 61. Diomedea albatrus Pallas. Tetrabothrius heteroclitus, p. 60. torulosus, p. 60. Phœbetria palpebrata (Forster). Tetrabothrius umbrella, p. 61.

Tatria biremis, p. 105.

#### CICONIIFORMES.

Phalacrocorax carbo (Linnæus). Dilevis scolecina, p. 72. Sula bassana (Linnæus). Tetrabothrius, species, p. 61. Sula leucogastra (Boddaert). Tetrabothrius pelecani, p. 60.

Fregata aquila (Linnæus). ? Tetrabothrius pelecani, p. 60.

Nycticorax nycticorax c (Linnæus). Tetrabothrius porrigens, p. 60. Gryporhynchus pusillus, p. 83. Hymenolepis microcephala. Butorides virescens (Linnæus). Dilepis unilateralis, p. 72. Hymenolepis ardex, p. 91. Tetracisdicotyla macroscolecina, p. 106.

a The typical form, C. dominicus dominicus is South American; C. dominicus brachypterus Chapman is the North American form.

b Hypothetical North American form.

The typical form is European; the North American form is N. nycticorax navius (Boddaert).

Florida cærulea (Linnæus). Plegadis guarauna (Linnæus). Dilepis papillifera, p. 72. ? Anonchotænia longiovata, p. 87. Dioicocestus paronai, p. 103. Anomotenia aurita, p. 77. Plegadis autumnalis (Linnæus). Casmerodius egretta (Gmelin). Dilepis unilateralis, p. 72. Dilepis urceus, p. 72. Ardea cinerea Linnæus. Hymenolepis microcephala, p. 94. Dilevis unilateralis, p. 72. \*Ajaia ajaja (Linnæus). Gruporhynchus cheilancristrotus, p. 83. \*Dilepis transfuga, p. 72. Humenolevis microcephala, p. 94. \*Cyclustera capito, p. 82. Tænia leuckarti, p. 107.

### ANSERIFORMES.

Mergus serrator Linnæus. Histrionicus histrionicus (Linnæus). Ophruocotule, species, p. 67. Hymenolepis pachycephala, p. 95. Hymenolepis gracilis, p. 93. Clangula clangula b (Linnæus). tenuirostris, p. 97. Hymenolepis coronula, p. 92. Diorchis parviceps, p. 99. macracanthos, p. 94. Fimbriaria fasciolaris, p. 105. Diploposthe lævis, p. 101. Mergellus albellus (Linnæus). Fimbriaria fasciolaris, p. 105. Humenolevis tenuirostris, p. 97. Aristonetta valisineria (Wilson). Oidemia americana Swainson and Rich-Humenolepis compressa, p. 92. ardson. Marila marila (Linnæus). Hymenolepis compressa, p. 92. Hymenolepis xquabilis, p. 90. Fimbriaria fasciolaris, p. 105. arcuata, p. 91. Txnia macrocantha, p. 107. compressa, p. 92. Oidemia fusca (Linnæus). coronula, p. 92. Lateriporus biuterinus, p. 73. fallax, p. 92. Hymenolepis microsoma, p. 95. gracilis, p. 93. tenuirostris, p. 97. megalops, p. 94. Fimbriaria fasciolaris, p. 105. microsoma, p. 95. pigmentata, p. 95. Somateria spectabilis (Linnæus). Hymenolepis microsoma, p. 95. tenerrima, p. 97. retracta, p. 96. tenuirostris, p. 97. sibirica, p. 96. species, p. 97. Aploparaksis birulai, p. 99. Diploposthe lævis, p. 101. Fimbriaria fasciolaris, p. 105. Somateria mollissima a (Linnæus). Tetrabothrius arcticus, p. 60. Netta rufina (Pallas). Lateriporus teres, p. 73. Hymenolepis lanceolata, p. 94. Diploposthe lævis, p. 101. Hymenolepis fallax, p. 92. microsoma, p. 95. Fimbriaria fasciolaris, p. 105. Cairina moschata c (Linnæus). tenuirostris, p. 97. Fimbriaria fasciolaris, p. 105. Lateriporus biuterinus, p. 73. Harelda hyemalis (Linnæus). ? Biuterina longiceps, p. 88. Lateriporus teres, p. 73. Hymenolepis bisaccata, p. 91. Choanotænia borealis, p. 75. lanceolata, p. 94. megalops, p. 94. Hymenolepis coronula, p. 92.

a The typical form occurs only in the Old World; the North American form is Somateria mollissima borealis Brehm.

grænlandica, p. 93.

microsoma, p. 95.

Fimbriaria fasciolaris, p. 105.

papillata, p. 95.

Cairina moschata domestica.

Fimbriaria fasciolaris, p. 105.

b The typical form occurs only in the Old World; C. clangula americana Bonaparte is the North American form.

c In its natural state this species occurs only in South America, but is domesticated in the United States.

\*Corvus ossifragus Wilson.

\*Anomotænia constricta, p. 78.

\*Corvus brachyrhynchos Brehm. \*Anomotænia constricta, p. 78.

Corvus corax b Linnæus.

Dilepis undula, p. 72. Anomotænia constricta, p. 78. Hymenolepis serpentulus, p. 96.

stylosa, p. 97.

Riparia riparia (Linnæus).

Anomotænia cyathiformis, p. 78. hirundina, p. 78.

Angularia beema, p. 84.

Txnia colliculorum, p. 106.

Progne subis (Linnæus).

Anonchotænia macrocephala, p. 87.

Anthus pratensis (Linnæus).

Dilepis attenuata, p. 71.

Gruporhunchus macrorostratus, p. 83. Tænia platycephala, p. 107.

Motacilla alba Linnæus.

Anomotænia borealis, p. 77.

Txnia muscicapx, p. 107.

Icteria virens (Linnæus).

Tænia pestifera, p. 107.

Oporornia formosa (Wilson).

Tænia oporornis, p. 107.

\*Dendroica striata (Forster).

\*Anonchotænia globata, p. 34.

Dolichonyx oryzivorus (Linnæus). Tænia pestifera, p. 107.

Molothrus ater (Boddært).

Biuterina trapezoides, p. 88.

Tænia urnigera, p. 107.

\*Melospiza melodia (Wilson).

\*Anonchotænia alobata, p. 34.

Plectrophenax nivalis (Linnæus).

Anomotænia borealis, p. 77.

Passer domesticus c (Linnæus).

Dilevis attenuata, p. 71.

Choanotænia parina, p. 75.

Monopylidium passerinum, p. 76.

Anonchotænia alobata, p. 34. Hymenolepis passeris, p. 93.

Passer montanus c (Linnæus).

Dilepis attenuata, p. 71.

Choanotænia parina, p. 75.

Anonchotænia globata, p. 34. Hymenolepis passeris, p. 93.

Ægiothus linaria (Linnæus).

Anonchotænia globata, p. 34.

Hymenolepis passeris, p. 93.

Loxia curvirostra d Linnæus.

Anonchotænia globata, p. 34.

a The typical form is confined to the Old World; the North American form is Pica pica hudsonia (Sabine).

b The typical form occursonly in the Old World; two North American forms are recognized, C. corax principalis Ridgway (northern), and C. corax sinuatus Wagler (southern).

c Introduced in North America.

d'The typical form occurs only in the Old World; the North American form is L. curvirostra minor (Brehm).

.

### BIBLIOGRAPHY.

The following bibliography includes all articles to which reference has been made in the present paper. The dates are those given in the Index Catalogue of Medical and Veterinary Zoology, Bull. 39, Bur. Anim. Industry, U. S. Dept. Agric. Dates which have not been verified are placed in parentheses. [Wa.] signifies that the article may be consulted in the Library of the Department of Agriculture; [Wc.], Library of Congress; [Wm.], Library of the Surgeon-General's Office, U. S. Army; [Ws.], Library of the Smithsonian Institution; [Yp.], New York Public Library.
